Appendix A TWDB Explanatory Report Checklist

Appendix B Meeting materials for GMA 14 meetings held during the 2011 - 2016 round of joint planning

Appendix T Resolution establishing administrative procedures for the consideration, proposal, and adoption of desired future conditions for Groundwater Management Area 14

1.0 EXECUTIVE SUMMARY

District Representatives in Groundwater Management Area 14 ("GMA 14") developed this Explanatory Report as part of the requirements included in Texas Water Code Section 36.108, as part of the joint-planning process for the current round of joint planning (September 1, 2010 – May 1, 2016). This GMA 14 Explanatory Report contains two main elements required in statute for the joint-planning process: the desired future conditions ("DFCs") statement for all relevant aquifers that was adopted by District Representatives for GMA 14 during a regularly scheduled meeting on April 29, 2016, and documentation of all data, analyses, and supporting materials including policy and technical issues considered by the District Representatives of GMA 14 from July 26, 2013, through April 29, 2016 All required considerations included in Texas Water Code Section 36.108 (d)(1-9) are included in this GMA 14 Explanatory Report.

The Texas Water Development Board ("TWDB") has made available an "Explanatory Report Checklist," which it uses to determine administrative completeness with respect to the requirements of statute and administrative rules. To facilitate this review by the TWDB, a populated Explanatory Report Checklist is included in *Appendix A*.

Groundwater conservation districts ("GCDs") located within a groundwater management area are required to meet at least annually to jointly review each other's management plans and consider proposals to adopt new or amended DFCs (Texas Water Code Section 36.108(c)). A DFC is "the desired, quantified condition of groundwater resources (such as water levels, spring flows, or volume) within a management area at one or more specific future times as defined by participating groundwater conservation districts within a groundwater management area as part of a joint-planning process." (31 Texas Administrative Code Section 356.10(6))

The TWDB designated the Northern Gulf Coast Aquifer System, made up of the Chicot Aquifer, the Evangeline Aquifer, the Burkeville Confining Unit, and the Jasper Aquifer, along with small portions of other major and minor aquifers, as GMA 14 (Figure 2-1). Included within GMA 14 are the following counties and GCDs:

Districts	Counties
Bluebonnet GCD	Austin
	Grimes
	Walker
	Waller
Brazoria County GCD	Brazoria
Lone Star GCD	Montgomery
Lower Trinity GCD	Polk
	San Jacinto
Southeast Texas GCD	Hardin
	Jasper
	Newton
	Tyler
Other	
Fort Bend Subsidence District	Fort Bend

Fort Bend Subsidence District Fort Bend
Harris-Galveston Subsidence District Galveston
Harris

No district

Chambers
Jefferson
Liberty
Orange
Washington

GMA 14 District Representatives first adopted DFCs in 2009. The GCDs in GMA 14 are required to adopt proposed 2016 DFCs before May 1, 2016. The District Representatives began joint-planning meetings focused on the review and adoption of updated DFCs in April of 2013, and held an additional ten meetings to develop proposed DFCs for each relevant aquifer in GMA 14. At their June 24, 2015, meeting, the District Representatives unanimously adopted the "RESOLUTION FOR THE APPROVAL OF PROPOSED DESIRED FUTURE CONDITIONS FOR ALL AQUIFERS IN GROUNDWATER MANAGEMENT AREA 14." The Resolution, along with supporting materials considered prior to adoption of the Resolution, was submitted to the individual GCDs on July 6, 2015. All of the Districts subsequently posted the public notices for individual GCD public hearings on the proposed DFCs as required by Texas Government Code Chapter 551 and by Texas Water Code Section 36.108(e). Copies of the public notices given for all required public hearings are contained in *Appendix B*. Subsequently, at their April 29, 2016, meeting, the District Representatives adopted the "RESOLUTION FOR THE APPROVAL OF DESIRED FUTURE CONDITIONS FOR ALL AQUIFERS IN GROUNDWATER MANAGEMENT AREA 14."

This Explanatory Report documents that the District Representatives in GMA 14 have considered all of the elements required by Texas Water Code Section 36.108(d-3) in establishing the 2016 DFCs by:

- (1) identifying each desired future condition;
- (2) providing the policy and technical justifications for each desired future condition;
- (3) documenting that the factors under Texas Water Code Section 36.108(d) were considered by the districts along with how the adopted desired future conditions impact each factor;
- (4) listing other desired future condition options considered, if any, and the reasons why those options were not adopted; and
- (5) discussing reasons why recommendations made by any advisory committee and relevant public comments received by the districts were or were not incorporated into the desired future conditions.

The primary tools for analyzing groundwater conditions and for groundwater management are computer simulations or models. Computer models are the preferred means of assessing the effects of past, current, and future pumping and droughts on groundwater availability. Modeling involves developing and using computer programs to estimate future trends in the amount of water available in an aquifer and is based on hydrogeologic principles, actual aquifer measurements, and stakeholder guidance. In correspondence dated February 18, 2014, the TWDB formally approved the updated Houston Area Groundwater Model ("HAGM") as the official Groundwater Availability Model ("GAM") for the Northern Segment of the Gulf Coast Aquifer System² ("Northern Gulf Coast Aquifer GAM") (*Appendix C*). The 2016 DFCs adopted are the result, in part, of the modeling prepared by the GMA's consultants using the updated Northern Gulf Coast Aquifer GAM.

Texas Water Code Section 36.108(d) requires GCDs to consider eight factors and other relevant information before adopting proposed DFCs and to prepare a report documenting that the factors were considered. The eight factors are discussed below.

¹ Kasmarek, M.C., 2012, Hydrogeology and simulation of groundwater flow and land-surface subsidence in the northern part of the Gulf Coast Aquifer System, Texas, 1891–2009 (ver. 1.1, December 2013): U.S. Geological Survey Scientific Investigations Report 2012–5154, 55 p., http://dx.doi.org/sir20125154; and Freese and Nichols, 2013, "Regional Groundwater Update Project – Final Report," for Harris-Galveston Subsidence District, Fort Bend Subsidence District, and Lone Star Groundwater Conservation District, http://hgsubsidence.org/wpcontent/uploads/2013/07/Regional Groundwater Update Project-Report-6-2013.pdf, 24 p.

² https://www.twdb.texas.gov/groundwater/models/gam/glfc n/glfc n.asp

1. AQUIFER USES AND CONDITIONS

The Gulf Coast Aquifer System is a predominant source of water for all of GMA 14. Groundwater data was obtained from the TWDB, which maintains records and reports of groundwater use, water wells, and other relevant data. The District Representatives received presentations from its technical consultants of the modeled effects of the adopted DFCs on existing aquifer uses and conditions.

2. WATER SUPPLY NEEDS AND WATER MANAGEMENT STRATEGIES

The District Representatives considered the water supply needs (the amount of projected water demand beyond existing supplies) and water management strategies (new water supplies to meet water supply needs) for GMA 14. Specifically, information on water supply needs and water management strategies from the 2011 Regional Water Plans and the 2012 State Water Plan was considered. GMA 14 includes parts of Regional Water Planning Areas G (Brazos), H, and I (East Texas). The reports show most future water supplies will be from sources other than groundwater.

3. <u>HYDROLOGIC CONDITIONS</u>

The District Representatives considered presentations and reports on the total estimated recoverable storage ("TERS"), average annual recharge, inflows and discharge. After the District Representatives began the work for the 2016 DFCs, the TWDB provided the TERS numbers for GMA 14, a required consideration in establishing the DFCs. TERS is the estimated amount of groundwater within an aquifer that accounts for recoverable storage scenarios that range between 25 percent and 75 percent of the porosity-adjusted aquifer volume. The District Representatives also considered potentiometric surface contour maps showing the current aquifer/hydrologic conditions. All of this information was used to set the adopted DFCs.

4. ENVIRONMENTAL FACTORS

The District Representatives considered the potential impacts by the DFC options on environmental factors such as spring flow and other interactions between groundwater and surface water. Available information from the models and other technical resources were presented. The District Representatives determined there are limited interactions between the aquifer systems as a whole and surface water within the region encompassing GMA 14.

5. SUBSIDENCE

Subsidence is a major factor in GMA 14. The GMA 14 consultants spent considerable time and effort to evaluate potential impacts by the DFCs on subsidence. The only means of preventing subsidence is stabilizing groundwater levels throughout the Gulf Coast Aquifer

System. The District Representatives concluded that the only means of stabilizing groundwater levels is to limit groundwater production.

6. SOCIOECONOMIC IMPACTS

The District Representatives considered the socioeconomic impact analysis provided by the TWDB to Water Planning Regions G, H, and I, for the 2011 Regional Water Plans. In addition, GMA 14 reviewed the socioeconomic impact data used by the Subsidence Districts in formulating their Regulatory Plans. While there are economic impacts to limiting groundwater production, the negative socioeconomic impacts of lower water quality, higher groundwater production costs and subsidence support the adopted DFCs.

7. PRIVATE PROPERTY RIGHTS

The District Representatives in GMA 14 extensively considered the potential effects of the DFCs on the interests and rights in private property. It was recognized that there are many property owners competing to pump groundwater and that excessive withdrawals can cause land subsidence, increased pumpage costs, and the lowering of water tables. District representatives reported individually on the impacts of the DFCs on private property rights and how GCD Management Plans and Rules have been developed to protect private property rights.

8. FEASIBILITY OF ACHIEVING THE DFCs

The District Representatives considered groundwater modeling and information about historic use, current and projected supplies, projected water demands, and applicable rules, regulations, and laws to determine that the DFCs are feasible. The GCDs and Subsidence Districts have adequate authority to implement regulations necessary to achieve the adopted DFCs.

9. OTHER RELEVANT INFORMATION

The GMA 14 District Representatives considered other material and relevant information as reflected in the materials contained in this Explanatory Report.

CONCLUSION

The District Representatives in GMA 14 have extensively reviewed and evaluated the adopted 2016 DFCs and determined that they are reasonable.

THIS PAGE INTENTIONALLY LEFT BLANK

2.0 INTRODUCTION AND FUNDAMENTALS OF THE JOINT-PLANNING PROCESS

In Texas, the legislature has declared groundwater conservation districts ("GCDs") as the preferred method of groundwater management.³ Local GCDs are required to manage, preserve, and protect the groundwater resources within their jurisdiction pursuant to their statutory powers and duties as set forth in Chapter 36 of the Texas Water Code and their respective enabling legislation. In 2005, the Texas Legislature passed legislation that created a joint-planning process by which GCDs located within a groundwater management area must conduct joint planning to develop Desired Future Conditions ("DFCs"). These DFCs describe how the GCDs in the management area want the groundwater resources of the region to look in the future. GCDs are statutorily obligated to regulate the production of groundwater on a long-term basis to achieve the DFCs for the applicable aquifer so that water is available for future generations of existing and new users.⁴

A groundwater management area ("GMA") is a geographic area designated and delineated by the Texas Water Development Board ("TWDB") under Chapter 35 of the Texas Water Code as an area suitable for management of groundwater resources. The TWDB designated a total of sixteen (16) GMAs, which together cover the entire State of Texas. The TWDB designated the area encompassing all of Austin, Brazoria, Chambers, Fort Bend, Galveston, Grimes, Hardin, Harris, Jasper, Jefferson, Liberty, Montgomery, Newton, Orange, Polk, San Jacinto, Tyler, Walker, Waller, and Washington counties as Groundwater Management Area No. 14 ("GMA 14"). GMA 14 is located along the Upper Texas Gulf Coast, and groundwater management efforts for GMA 14 are primarily focused on the Gulf Coast Aquifer System.

The Bluebonnet Groundwater Conservation District (Austin, Grimes, Walker, and Waller counties), Brazoria County Groundwater Conservation District (Brazoria County), Lone Star Groundwater Conservation District (Montgomery County), Lower Trinity Groundwater Conservation District (Polk and San Jacinto counties), and Southeast Texas Groundwater Conservation District (Hardin, Jasper, Newton, and Tyler counties) are GCDs located wholly in

³ Tex. Water Code § 35.0015 (West 2015).

⁵ Tex. Water Code § 35.004(a), Act of May 23, 2005, 79th Leg., R.S., ch. 970, 2005 Tex. Gen. Laws 3247.

⁶ One small change to the GMA 12 and GMA 14 boundaries was made by the TWDB during the current round of joint-planning in that the small portion of Brazos County originally assigned to GMA 14 was moved to GMA 12, so that all of Brazos Valley GCD is now located in GMA 12. *See* TWDB correspondence from Kevin Patteson, Executive Administrator to Alan Day, General Manager, Brazos Valley GCD, dated November 25, 2013.

the boundaries of GMA 14 (see Figure 2.1). As required by Chapter 36 of the Texas Water Code, and further described herein, these GCDs have engaged in joint planning and, in that regard, have adopted DFCs for the groundwater resources underlying GMA 14. The Fort Bend Subsidence District (Fort Bend County) and Harris-Galveston Subsidence District (Harris and Galveston counties), special districts created by the Texas Legislature to regulate groundwater withdrawals for the purpose of preventing land subsidence, and other stakeholders within GMA 14 from Chambers and Washington counties also contributed to the joint-planning process. These stakeholders participated in an unofficial role to aid in the development of the DFCs by providing the District Representatives in GMA 14 important information and data relevant to their respective counties that are otherwise not represented by the GCDs in the GMA joint-planning process.

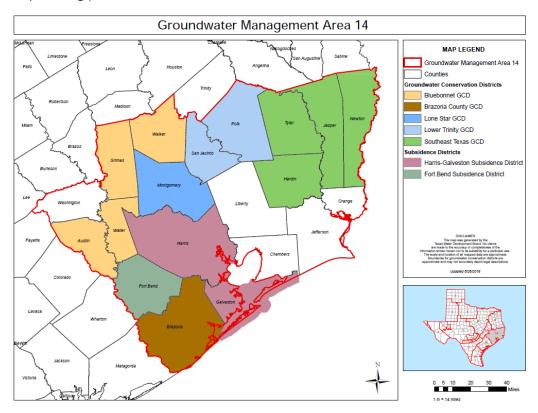

Figure 2-1 – Map illustrating GMA 14 boundary, counties, groundwater conservation districts, and subsidence districts 7

The joint-planning process for coordination of groundwater management activities by GCDs was first amended by the Texas Legislature to include the requirement to establish DFCs with the passage of House Bill ("HB") 1763 in 2005.8 HB 1763 amended Chapter 36, Texas

⁷ Source TWDB: See http://www.twdb.texas.gov/groundwater/management_areas/maps/GMA14_GCD.pdf.

⁸ Act of May 24, 2005, 79th Leg., R.S., ch. 970, 2005 Tex. Gen. Laws 3247.

Water Code, to require representatives of GCDs located within a GMA to meet and adopt DFCs for the aquifers underlying the GMA no later than September 1, 2010, and every five years thereafter. After the first round of DFCs were adopted by the initial 2010 deadline, the joint-planning process was significantly expanded with the passage of Senate Bill ("SB") 660 in 2011. In order to allow GCDs more time to meet the new statutory requirements established by SB 660, and to allow for the completion of several major GAM updates, the deadline for adopting proposed DFCs for the second round of joint-planning was extended to May 1, 2016, by the passage of Senate Bill 1282 in 2013.

Texas Water Code Section 36.108 provides the current requirements applicable to this second round of joint planning and DFC development. As set forth in the statute, representatives from each GCD within the same GMA are required to meet as a committee, at least annually, to consider each other's groundwater management plans, accomplishments in the GMA, and proposals to adopt new or amend existing DFCs. At least every five years, the GCD representatives must meet to consider groundwater availability models and other data and information for the GMA and propose for adoption DFCs for the relevant aquifers within the GMA.¹²

In developing proposed DFCs, the GCDs must consider nine statutory factors: (1) the aquifer's uses or conditions within the management area, including conditions that differ substantially from one geographic area to another; (2) the water supply needs and water management strategies included in the state water plan; (3) hydrogeological conditions; (4) other environmental impacts such as spring flow and other interactions between groundwater and surface water; (5) the impact on subsidence; (6) socioeconomic impacts reasonably expected to occur; (7) the impact on the interests and rights in private property; (8) the feasibility of achieving the DFC; and (9) any other relevant information.¹³ After consideration of these factors, the representatives of the GCDs in the GMA ("District Representatives") must approve by a two-thirds vote proposed DFCs.¹⁴. The proposed DFCs must provide a balance between the highest practicable level of groundwater production and the conservation, preservation, protection, recharging, and preventing of waste of groundwater and control of subsidence in the GMA.¹⁵

⁹ TEX. WATER CODE ANN. § 36.108(c)–(d-1) (West 2010).

¹⁰ Act of May 29, 2011, 82nd Leg., R.S., ch. 1233, 2011 Tex. Gen. Laws 3287

¹¹ Act of May 20, 2013, 83rd Leg., R.S., ch. 786, § 1, 2013 Tex. Gen. Laws 2001 (codified at TEX. WATER CODE § 36.108(d-5)).

¹² TEX. WATER CODE ANN. § 36.108(c),(d) (West 2015).

¹³ § 36.108(d)(1-9).

¹⁴ § 36.108(d-5).

¹⁵ § 36.108(d-2).

Once approved by the District Representatives in the joint-planning committee, the proposed DFCs are sent to the individual GCDs within the GMA, and a 90-day public comment period begins. ¹⁶ During the 90-day public comment period, each GCD is required to hold a public hearing on any proposed DFCs relevant to that GCD. ¹⁷ After the public hearing, each GCD is required to compile for consideration at the next joint-planning meeting a summary of the relevant comments received, suggested revisions to the proposed DFCs, and the basis for the suggested revisions. ¹⁸ The joint-planning committee is required to reconvene to review the summary reports prepared by the GCDs, consider proposed changes to the DFCs, and finally adopt DFCs by a two-thirds vote of all the District Representatives in the GMA. ¹⁹ Upon final adoption, the joint-planning committee is required to prepare and submit an Explanatory Report to the TWDB and the individual GCDs. ²⁰

This joint-planning process established by HB 1763 in 2005 and amended by SB 660 in 2011 is a public, transparent process, where all planning decisions are made in open, publicly noticed meetings in accordance with provisions of Texas Water Code Chapter 36. GMA 14 began this joint-planning process in 2010. Over the course of several years, the District Representatives in GMA 14 held multiple joint-planning meetings, and in a coordinated effort to manage the groundwater resources, adopted DFCs for the relevant aquifers in GMA 14. A timeline of the GMA 14 joint-planning process and significant events, including but not limited to the development of the updated groundwater availability model, the consideration of model run results, the consideration of information applicable to each of the statutory factors, the approval of proposed DFCs, the public comment period, and the adoption of DFCs, is provided in *Appendix D*.

This Explanatory Report provides an official record demonstrating compliance with all statutory requirements applicable to the joint-planning process and the adoption of DFCs. As part of this Explanatory Report, documentation of all meetings conducted by the joint-planning committee and the individual GCDs in GMA 14, including duly posted GMA 14 meeting agendas, approved GMA 14 meeting minutes, individual GCD public hearing notices, and individual GCD meeting minutes documenting individual public hearings, is included in *Appendix B*. This documentation establishes that through appointed District Representatives, the GCDs in GMA 14 participated in joint planning and held multiple joint-planning committee meetings over the course of several years to develop DFCs as required by statute. As described in the agendas and meeting minutes, the GCDs considered the statutory criteria required prior

¹⁶ § 36.108(d-2).

¹⁷ § 36.108(d-2).

¹⁸ § 36.108(d-2).

¹⁹ § 36.108(d-3).

²⁰ § 36.108(d-3).

to the adoption of proposed DFCs, and properly adopted proposed DFCs in accordance with procedural requirements.²¹ Upon receipt of the proposed DFCs, the individual GCDs properly provided a 90-day public comment period and held hearings as evidenced by the public hearing notices and minutes.

Also, as part of the record included in this Explanatory Report by reference, are the five individual GCD Summary Reports prepared and presented at the October 28, 2015, GMA 14 joint-planning meeting. These Summary Reports contain documentation of all public comments received by the individual GCDs at each of the five public hearings on the proposed DFCs, along with any recommendations for changes to the proposed DFCs offered by the individual GCDs that were considered by the GMA 14 joint-planning committee. On April 29, 2016, the District Representatives adopted DFCs for the groundwater resources in GMA 14, as further described in Section 3.0 of this Explanatory Report.

٠

²¹ The District Representatives also adopted an administrative procedural process consistent with Chapter 36, Texas Water Code, including the procedural requirements currently in place under Section 36.108, for the consideration, proposal, and adoption of DFCs to ensure the development of a clear administrative record that not only supports the DFCs ultimately adopted, but also addresses any DFCs considered but not adopted, in a manner that is sufficient for inclusion in this Explanatory Report as required by Texas Water Code Section 36.108(d-3). See *Appendix T* for administrative procedures adopted by GMA 14 District Representatives.

²² These Summary Reports are available by request from each of the GCDs in GMA 14, but are not physically included in this Explanatory Report due to the combined length of each report (in excess of 1,000 pages). To request a specific Summary Report, please request from the individual GCD General Manager.

3.0 GMA 14 DESIRED FUTURE CONDITIONS

The following Statements of Desired Future Conditions is excerpted from GMA 14 Resolution2016-01-01. The resolution in its entirety is presented in *Appendix E*. This resolution was adopted by GMA 14 District Representatives, after providing notice as required, on April 29, 2016. GMA 14 DFCs are based on model results utilizing the updated Northern Gulf Coast Aquifer Groundwater Availability Model (Northern Gulf Coast GAM), which was designated by TWDB as the official model of record for GMA 14 (Appendix C). GMA 14 utilized predictions of pumping contained in a predictive simulation referred to as Northern Gulf Coast GAM Run 2. All technical guidance necessary to review and reproduce the Northern Gulf Coast GAM Run 2 is included in Appendix F.

3.1 FORMATIONS OF THE GULF COAST AQUIFER

DFCs for the Gulf Coast Aquifer System adopted by GMA 14, as documented by and incorporating herein Northern Gulf Coast GAM Run 2, at two scales, which do not differ substantively in their application: the first being for GMA 14 in its entirety; the second being to better facilitate the management and conservation of groundwater resources at the individual GCD level, after considering the statutory criteria set forth under Texas Water Code Section 36.108(d), on a county-by-county basis. DFCs for GMA 14 for the Gulf Coast Aquifer System are as follows:

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 28.3 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 23.6 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 18.5 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 66.2 feet after 61 years.

3.1.1 Austin County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 39 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 23 feet after 61 years.

- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 76 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Austin County should not exceed approximately 2.83 feet by the year 2070.

3.1.2 Brazoria County (BCGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 27 feet after 61 years.

3.1.3 Chambers County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 32 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 30 feet after 61 years.

3.1.4 Grimes County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 5 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 5 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 6 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 52 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Grimes County should not exceed approximately 0.12 feet by the year 2070.

3.1.5 Hardin County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 21 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 27 feet after 61 years.

- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 29 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 89 feet after 61 years.

3.1.6 Jasper County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 41 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 46 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 40 feet after 61 years.

3.1.7 Jefferson County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 15 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 17 feet after 61 years.

3.1.8 Liberty County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 27 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 29 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 25 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 120 feet after 61 years.

3.1.9 Montgomery County (LSGCD)

• From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 26 feet after 61 years.

- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately -4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately -4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 34 feet after 61 years.

3.1.10 Newton County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 35 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 45 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 44 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 37 feet after 61 years.

3.1.11 Orange County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 14 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 16 feet after 61 years.

3.1.12 Polk County (LTGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 26 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 10 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 15 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 73 feet after 61 years.

3.1.13 San Jacinto County (LTGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 22 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 19 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 19 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 108 feet after 61 years.

3.1.14 Tyler County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 42 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 35 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 30 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 62 feet after 61 years.

3.1.15 Walker County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 9 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 42 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Walker County should not exceed approximately 0.04 feet by the year 2070.

3.1.16 Waller County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 39 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 39 feet after 61 years.

- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 40 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 101 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Waller County should not exceed approximately 4.73 feet by the year 2070.

3.1.17 Washington County

- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 1 foot after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 16 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 48 feet after 61 years.

3.1.18 Formations in Fort bend, Galveston, and Harris Counties

GMA 14 efforts to determine DFCs are primarily an aquifer water-level-based approach to describe the regional and local desires for the aquifer beneath them. The GMA process requires GCDs to determine the DFCs for the entire GMA, regardless of whether each county is included within a GCD. The Fort Bend Subsidence District ("FBSD") and the Harris-Galveston Subsidence District ("HGSD"), operating in Fort Bend County and Harris and Galveston counties, respectively, regulate groundwater for the purpose of ending land surface subsidence within their jurisdiction. The two Subsidence Districts are not subject to Chapter 36, are not GCDs, and operate under separate enabling legislation that is different from the typical GCD. Therefore, in an official context these three counties are "unrepresented" but the GCDs within GMA 14 must still determine the DFC for these counties.

Both FBSD and HGSD have participated in an unofficial role to aid the GCDs within GMA 14 with their evaluation of Fort Bend, Galveston and Harris County information. The groundwater pumpage within these three counties even though regulated is still greater than the sum of all other counties within GMA 14.

FBSD and HGSD recognize that the projected groundwater pumpage from these three counties will impact the decisions of GMA 14 throughout a large portion of the area. FBSD and HGSD have provided considerable historical and projected groundwater pumpage data and details of regulations to assist GMA 14 in incorporating these counties in the overall GMA 14 DFCs. FBSD and HGSD cannot, however, present DFCs for these three counties in terms of aquifer water-level changes over time. The FBSD and HGSD regulations do not specifically

address water levels nor do they designate a specific pumping limit. Rather, the regulations are based on limitations of groundwater as a percentage of total water demand. The percentage of groundwater to total water demand is decreased over time, as total water demand increases.

The goal of both FBSD and HGSD is to end land surface subsidence, which is caused by humankind's pumpage of groundwater. There is a clearly established link between the overpumpage of groundwater and land surface subsidence. The DFCs within the aquifer beneath Fort Bend, Galveston, and Harris counties has no easily defined relationship to water levels. The DFC for FBSD and HGSD is the reduction and halting of the compaction of clay layers within the aquifer caused by the over-pumpage of groundwater. Stated more simply, the DFC for these three counties is that future land surface subsidence be avoided. That stated, HGSD and FBSD have adopted regulations, updated most recently in 2013²³, that require the reduction of groundwater pumpage and the conversion to alternate source waters balanced against the realistic ability of the permittees to achieve compliance with these regulations. This effort was accomplished with the aid of the HAGM and information specific to the population projections and future water demands within FBSD and HGSD.

Within HGSD, from central to southeastern Harris County and all of Galveston County (Regulatory Areas 1 and 2), virtually all permittees have achieved compliance with previous and current HGSD regulations. Subsidence has been halted and water levels within the aquifer have risen dramatically in these areas. However, in northern and western areas of Harris County (Regulatory Area 3), the HGSD regulations have allowed groundwater pumpage to continue until the required reductions in 2010, 2025, and 2035. With these scheduled reductions in groundwater pumpage, subsidence will slow dramatically and even be halted with water levels stabilizing and in later years rising.

Within FBSD, from central to northern and eastern Fort Bend County (Regulatory Area A), the regulations call for reductions of groundwater pumpage in 2014/2016, and 2025. Similar to HGSD's Regulatory Area 3, subsidence within FBSD Regulatory Area A will slow dramatically and even be halted with water levels stabilizing and in later years rising.

In both HGSD and FBSD, because of the percentage based approach to regulations, groundwater pumpage will increase until scheduled reductions in milestone years (ex: 2010, 2014/2016, 2025, and 2035). In between milestone years, groundwater pumpage will increase with the assumed increase in total water demand from a predicted increase in population. In

http://www.fbsubsidence.org/docs_reports/2015/20130828_FBSD_Regulatory_Plan_ADOPTED_(FINAL).pdf

²³ The HGSD <u>District Regulatory Plan is</u> <u>available at http://hgsubsidence.org/wp-content/uploads/2013/07/HGSD-2013-Regulatory-Plan-with-Amendment.pdf</u>; the FBSD <u>District Regulatory Plan</u> is <u>available at</u>

order to demonstrate the DFC of these three counties using water-level changes, the area of previous groundwater-to-alternative water conversions must be separated from future conversions and each annual time step must be depicted.

The HGSD and FBSD have submitted to GMA 14 their current regulations and projected groundwater pumpage projections through the year 2070. This data has been divided into the grid cells/layers relative to the NGCGAM and utilized by the GCDs in development of their DFCs.

Groundwater pumpage within GMA 14 from Fort Bend, Galveston, and Harris counties is regulated by FBSD and HGSD, non-GCD governmental agencies (the only GMA in Texas with this occurrence), and the missions of HGSD and FBSD are very different from GCDs and do not fit well with a water-level designed DFC process). The groundwater pumpage projections developed in recognition of the HGSD and FBSD regulatory plans have been utilized without adjustment by GMA 14 in the DFC process. Therefore, the DFCs adopted by GMA 14 are consistent with the HGSD and FBSD regulatory plans.

3.2 NON-RELEVANT AQUIFERS

TWDB rules²⁴ allow for portions of major or minor aquifers to be classified as non-relevant if their aquifer characteristics, groundwater demands, and current groundwater uses do not warrant adoption of a desired future condition. After review, District Representatives in GMA 14 have classified all portions of the following aquifers located within GMA 14 boundaries as non-relevant aquifers for the purposes of Joint-planning; (1) Carrizo Sand Aquifer, (2) Queen City Aquifer, (3) Sparta Aquifer, (4) Yegua-Jackson Aquifer, and (5) all river alluvium aquifers.

4.0 POLICY AND TECHNICAL JUSTIFICATIONS

The "policy and technical justifications for each DFC" 25 are embodied by, and not differentiable from, the careful consideration and balancing by the GMA 14 District Representatives of all of the technical and policy information that was considered in working through the statutory criteria as set forth in Section 5 of this report. There is no stand-alone policy justification or technical justification that can be easily identified and presented as the sole policy or technical reason that the GMA 14 District Representatives ultimately decided on the DFCs that were adopted. The balancing of all the various information required to be considered by statute and the balancing of competing interests and the exercise of discretion in performing that balancing act is the justification for the adopted DFCs. Nonetheless, set forth below are some of the policy and technical justifications that can be gleaned from the information considered by GMA 14 in its evaluation and adoption of the DFCs.

4.1 POLICY JUSTIFICATIONS

The most important task for GMA 14 District Representatives in developing and adopting DFCs is to carefully consider all available information related to the aquifers and their past, present, and future use—including, without limitation, all information related to the statutory considerations set forth in Section 5 of this report—and to achieve an appropriate balance of those criteria using their best judgment and discretion. From a policy perspective, a number of key considerations emerge from that balancing act that justify the adopted DFCs.

Heavy growth in population and water demand in GMA 14 have outstripped the ability of the aquifers to keep pace—they are being slowly depleted. Depleting the aquifers harms the property rights of those currently pumping groundwater, those who hope to pump groundwater in the future, and those whose property may be damaged by subsidence. The task for the GMA 14 District Representatives therefore becomes determining how much of that depletion, if any, should occur in each layer of the aquifer and in each geographic area of the region between now and 2070, and how to best avoid damaging any private property rights.

The two overriding policy justifications for the DFCs adopted by GMA 14 are socioeconomic considerations and impacts on private property rights. All of the other technical information and policy issues feed into these two essential considerations, which themselves are inextricably tied to one another.

²⁵ Tex. Water Code § 36.108 (d-3)(2) (West 2015).

The primary economic and private property impact analyses that were considered by the GMA 14 District Representatives that justify the adoption of the DFCs were the impacts of those DFCs on the economic costs to landowners of producing groundwater. The evidence clearly indicates that economic considerations, and their inseparability from protection of private property rights, are the controlling factor behind the selection of the adopted DFCs. The amount of groundwater located under the geographic area defined by GMA 14 is ultimately not a controlling consideration. It is indisputable that it is impossible to physically produce all of the groundwater in the aquifers, even if the GMA 14 District Representatives desired to allow it to be produced. It is also indisputable that if water levels continue to drop the economic costs associated with producing groundwater and, in some instances, treating it for beneficial use, will ultimately control whether it can actually be produced long before the question of how much can be physically produced comes into play. Thus, the economic costs associated with groundwater production and use dictate how much groundwater should be produced during the planning horizon. Those economic costs fall into two primary areas in GMA 14: (1) the economic cost to the individual landowner to drill a well and produce groundwater of a sufficient quality and in sufficient quantities as to be beneficial to the landowner; and (2) the economic cost to the individual landowner of the preservation of the value of their surface estates as that value is impacted by groundwater production from the common groundwater reservoir, especially in terms of land subsidence.

When considering the economic cost to individual landowners to drill a well and produce groundwater, a number of factors were considered. How much an individual landowner has to pay to drill a producing water well is largely driven by how deep the well must be drilled to reach the groundwater. How much an individual landowner has to pay to lift the water from the pump to the land surface is also a consideration, not only in terms of the cost to properly equip the well with the appropriate pump and the wiring to go all the way down the well bore, but also in terms of the ongoing cost of energy to lift the water. Also, the water needs to be of a sufficient quality that it can be either used for its beneficial purpose without treatment or with economically affordable treatment, and water quality tends to diminish as water levels decline in the aquifer and landowners are forced to produce everdeepening groundwater resources. And, finally, the amount of groundwater that the water well will yield at the land surface, when weighed along with the other considerations, is almost always an important consideration, if not the controlling consideration, for a landowner in determining whether drilling a well is economically feasible for the intended purpose.

The vast majority of groundwater produced in GMA 14 comes from the subcrop areas of the various layers of the Gulf Coast Aquifer where confining conditions create artesian pressure and push groundwater into and up water well bores and to water well pumps. That fact is what makes the Gulf Coast Aquifer in GMA 14 such a beneficial water supply resource

to the overlying landowners. Without preservation of that artesian pressure, the costs of drilling a well, equipping the well, lifting the water to the surface, the huge impacts to well yields, and in some cases water quality degradation would simply render the option of a water well economically infeasible to most landowners as a source of water supply. And for large numbers of landowners throughout GMA 14, it is the only water supply option available to their properties. Without water being economically available on their properties, the negative impacts to the landowners' property values in most situations are enormous and devastating.

Individual landowners have differing needs for groundwater and widely differing abilities to produce it. Some landowners, such as large municipal water suppliers and industrial users, have the financial wherewithal to drill the deep multi-million-dollar water wells necessary to chase falling water levels, to lift that water to the surface and to treat it, if necessary. Other landowners, such as individual homeowners, small businesses, and farmers who must irrigate crops, do not have the financial resources to drill deep wells and treat lower quality water, and must necessarily rely on the preservation of artesian conditions and the ability to drill water wells that are affordable to drill, equip, and produce in order to realize the benefits of their private property investments. Even landowners who do not drill their own water wells but rather rely upon a public water system count on their monthly water bills from the supplier to be affordable.

Existing water-well owners have made investments in their water wells and the economic activities that those wells support, and have reasonable expectations that those investments will continue to be recovered in the foreseeable future. Many of those investments have been made in reliance on the preservation of artesian conditions. If water levels fall too low, they may have to endeavor to re-equip their wells and lower their pumps to chase falling water columns. In many instances, the pumps simply cannot be lowered any further and the well will have to be drilled deeper or abandoned altogether, resulting in huge negative economic losses for the well owners.

Future well owners and landowners also have an expectation of being able to drill affordable water wells on their properties. The same considerations set forth above apply to this class of property owners, whether they be individual homeowners in a rural area with limited financial resources or huge regional water authorities who must answer to their ratepayers. Virtually all of them, both existing and future, both large and small, count upon the availability of quality water in sufficient quantities at a reasonable depth from the land surface. In GMA 14, by and large, this means preservation of artesian conditions in the subcrop of the Gulf Coast Aquifer and preservation of an adequate amount of saturated thickness in its outcrop throughout the joint-planning period.

Another major economic consideration of the DFCs, especially in the coastal regions of GMA 14, is the impact of groundwater production on land subsidence. For the better part of

the last half-century, the coastal areas of GMA 14 have been working diligently to address the issues associated with land subsidence and the devastating economic losses to landowners and their private property investments from the periodic widespread flooding associated with that land subsidence. Groundwater production has clearly been demonstrated to be the primary cause of land subsidence, and millions upon millions of dollars have been invested in researching the amount of groundwater that can be produced in the region as weighed against the correlating subsidence of the land surface and its disastrous economic consequences. The GMA 14 District Representatives carefully considered this important factor and the research and data supporting it in developing and adopting the DFCs.

The DFCs adopted by GMA 14 strikes the appropriate balance of preservation of those artesian conditions, and of the preservation of the saturated thickness of the water levels in the outcrop areas of the aquifer layers. This balance allows for the economically feasible production of groundwater and the prevention of land subsidence. These DFCs, in light of the economic and private property impacts to all landowners in the region, are therefore justifiable adoptions.

4.2 TECHNICAL JUSTIFICATIONS

It is impossible to articulate the technical justifications for the adopted DFCs in terms that are not intricately connected to the policy justifications set forth above. Rather, the technical information considered by the GMA 14 District Representatives in balancing the competing interests associated with the establishment of the DFCs and evaluating the various interests and economic costs to landowners associated with groundwater production both drive and support those policy justifications.

As set forth in Section 4.1, the adopted DFCs are primarily focused on achieving the appropriate balance of all of the statutory criteria required to be considered by maintaining appropriate water levels in all areas of GMA 14, whether in terms of maintaining appropriate artesian levels in the subcrop areas of the aquifer's layers or water table levels and saturated thickness in the outcrop areas. In that regard, while this section will highlight a number of the technical justifications for the adopted DFCs, all of the technical information set forth under Section 5 of this report was considered by the GMA 14 District Representatives in their development and adoption of the DFCs and will not be restated in its entirety in this section.

The GMA 14 District Representatives relied heavily upon the use of the HAGM (Northern Gulf Coast GAM), which was developed by the U. S. Geological Survey (USGS) in cooperation with the Harris-Galveston Subsidence District, the Fort Bend Subsidence District, and the Lone Star Groundwater Conservation District, in the development and adoption of the

DFCs.²⁶ The Northern Gulf Coast GAM simulates groundwater flow and potentiometric surface declines in the northern Gulf Coast Aquifer in the GMA 14 region, and (in conjunction with the Subsidence Module) land-surface subsidence. It is presently the best available technical tool for modeling different groundwater-production scenarios in GMA 14 and the resulting impacts to the various layers of the Gulf Coast Aquifer in terms of water level declines in both the subcrop and outcrop areas of the aquifer, and impacts to the land surface from the resulting subsidence. The utilization of this tool by the GMA 14 District Representatives, which represents the best available science at the present time, to consider the impacts of pumping throughout the GMA 14 region and the extensive review by the GMA 14 District Representatives of contour maps of the potentiometric surfaces of the various aquifers within GMA 14 and of the predicted impacts on land subsidence provides technical justification for the adopted DFCs.

The GMA 14 District Representatives also considered both the current and planned future uses of the Gulf Coast Aquifer in the region, projected population and water demand growth over the joint planning horizon, and identified water supply needs and water management strategies from the approved regional and state water plans. The information considered represents the best available information on these topics. By and large, the adopted DFCs are consistent with the recommended water management strategies in the approved regional and state water plans that rely on groundwater from the Gulf Coast Aquifer, which strategies were formulated after consideration of the current and planned future uses of the aquifer and the projected population growth, water demand growth, and identified water supply needs over the ensuing 50-year planning period. Therefore, the DFCs adopted by the GMA 14 District Representatives are technically justified.

The GMA 14 District Representatives also considered the environmental impacts of the adopted DFCs in terms of impacts to spring flows and interaction with surface water resources. Because it was determined that there is negligible interaction between the northern Gulf Coast Aquifer System and spring flows and surface water resources, the water level declines associated with the adopted DFCs are technically justified.

The GMA 14 District Representatives also carefully considered the total estimated recoverable storage (TERS) estimates for the Gulf Coast Aquifer that were provided by the executive administrator of the TWDB. As set forth in greater detail later in this report, because the GMA 14 District Representatives determined the maintenance of artesian conditions in the subcrop was a primary consideration for the protection of private property rights and

²⁶ Kasmarek, M.C., 2012, Hydrogeology and simulation of groundwater flow and land-surface subsidence in the northern part of the Gulf Coast Aquifer System, Texas, 1891–2009 (ver. 1.1, December 2013): U.S. Geological Survey Scientific Investigations Report 2012–5154, 55 p., http://dx.doi.org/sir20125154.

mitigation of economic impacts to landowners in being able to affordably access groundwater in the establishment of the DFCs, and because artesian conditions are largely eliminated long before a question of how much total recoverable storage is actually in the aquifer if economic costs to produce were of no consideration, the adopted DFCs are technically justified.

4.3 RESPONSE TO COMMENTS

As part of the joint-planning process in GMA 14, five issues were discussed on numerous occasions that warrant documentation in this Explanatory Report. The issues are:

- (1) the establishment of DFCs on the basis of geographic area;
- (2) the failure to factor economic and hydrologic constraints into the calculation of TERS;
 - (3) the evaluation of socioeconomic impacts of proposed DFCs;
- (4) historical water use estimates for the Gulf Coast Aquifer System by formation, i.e., Chicot, Evangeline, and Jasper; and
- (5) the development of DFCs for unprotected counties (counties not incorporated into a GCD).

Another issue discussed early in this round of joint planning is the need to potentially revisit the use of general head boundary conditions in the Northern Gulf Coast Aquifer GAM.

On June 24, 2015, GMA 14 District Representatives approved the adoption of proposed DFCs for the Gulf Coast Aquifer System in GMA 14. The proposed DFCs provided acceptable drawdown levels for each subdivision of the Gulf Coast Aquifer (the Chicot, Evangeline, Burkeville, and Jasper formations/aquifers) throughout the GMA and for each county located within GMA 14, as well as acceptable land subsidence levels. The acceptable levels of drawdown for each subdivision of the Gulf Coast Aquifer were measured in terms of water level drawdowns over the current planning cycle measured in feet from 2009 estimated water levels. As required by Texas Water Code Section 36.108(d-2), the proposed DFCs were subsequently distributed to the individual GCDs in GMA 14. A period of not less than 90 days was provided to allow for public comments on the proposed DFCs, and during this comment period, each GCD held a public hearing on the proposed DFCs.²⁷

The GCDs in GMA 14 evaluated all comments received, including a claim that the adoption of different DFCs for different geographic areas over the same aquifer—along the boundaries of political subdivisions—was not authorized by law, and as such the proposed DFCs were legally and hydrogeologically insufficient. The comments suggested that the proposed DFCs would cause GCDs to adopt different regulatory schemes, including different production limits, allowing landowners producing groundwater in GCDs with less restrictive

²⁷ See TEX. WATER CODE ANN. § 36.108(d-2) (West 2015)

regulations to unfairly drain groundwater from landowners in adjacent GCDs with more restrictive regulations potentially causing a regulatory taking of property by the GCDs.

First, the selected DFCs cover the entirety of each aquifer subdivision throughout GMA 14. Once the aquifer-wide DFC is selected, the average drawdown for each county and each GCD is then calculated. The commenters mistakenly interpreted these calculations as separate DFCs for each county instead of the calculated average of the GMA-wide DFCs.

The adoption of DFCs by GCDs, pursuant to the requirements and procedures set forth in Texas Water Code Chapter 36, is an important policy-making function. DFCs are planning goals that state a desired condition of the groundwater resources in a GMA in the future in order to promote better management of those resources on a long-term basis. GCDs are authorized to utilize different approaches in developing and adopting DFCs based on local conditions and the consideration of other statutory criteria as set forth in Texas Water Code Section 36.108.

Second, Texas Water Code Section 36.108(d)(1) contemplates and authorizes the adoption of different DFCs for different geographic areas over the same aquifer, and that area may be based on the boundaries of political subdivisions. The statute expressly and specifically directs GCDs "to consider uses or conditions of an aquifer within the management area, including conditions that differ substantially from one geographic area to another" when developing and adopting DFCs.²⁸ The use of the singular "aquifer" in this context clearly demonstrates that the Legislature intended that the uses and conditions in different geographic areas over the same aquifer were to be considered when adopting DFCs.

Third, Texas Water Code Section 36.108(d-1) provides that GCDs may establish different DFCs for:

- 1) each aquifer, subdivision of an aquifer, or geologic strata located in whole or in part within the boundaries of the management area; *or*
- 2) each geographic area overlying an aquifer in whole or in part or subdivision of an aquifer within the boundaries of the management area.²⁹

The Legislature's addition of the phrase "in whole or in part" makes it clear that GCDs may establish a "different" DFC for a geographic area that does not cover a whole aquifer but only part of that aquifer. Moreover, the plain meaning of the term "geographic area" in this context clearly includes an area defined by political boundaries such as those of a GCD or a

-

²⁸ Id. § 36.108(d)(1) (emphasis added).

²⁹ Id. § 36.108(d-1) (emphasis added).

county.³⁰ Any other reading of "geographic area" in Texas Water Code Section 36.108(d-1) would be highly strained and contrary to the obvious intent of the larger statute.³¹

Such statutory authorization has also been recognized by the Texas Water Development Board (TWDB). In 2009, after GMA 1 adopted different DFCs for different geographic areas over the same aquifer (the Ogallala Aquifer) along the boundaries of political subdivisions, Mesa Water, LP and G&J Ranch (collectively the "Petitioners") filed a petition with the TWDB to appeal the reasonableness of the adopted DFCs.³² Petitioners made the same complaints in opposition of the DFCs adopted by GMA 1 raised in the comments received in GMA 14. In their appeal of the DFCs adopted by GMA 1, Petitioners argued that, overall, the DFCs had no scientific basis and that the DFCs should be uniform on an aguifer-wide basis to ensure all areas and landowners receive "equal treatment." However, on February 17, 2010, the TWDB considered and approved its staff's recommendation that the DFCs adopted by GMA 1 were reasonable.³³ The TWDB staff's analysis concluded that political boundaries, such as county lines, can be used to define geographic areas for different DFCs provided that aquifer uses and conditions support the designation of the areas. In reaching this conclusion, TWDB staff addressed private property rights, stating that "[t]o one degree or another, all DFCs adopted by groundwater conservation districts potentially impact the exercise of private property rights."³⁴ The TWDB staff explained that "beyond outright prohibition, the impact on private property rights involves the balancing of competing interest."35

During the joint planning process for GMA 14, District Representatives considered uses and conditions of the Gulf Coast Aquifer System, as required by Texas Water Code Section 36.108(d)(1). District Representatives studied uses and conditions for each subdivision of the Gulf Coast Aquifer System, including the Chicot, Evangeline, Burkeville, and Jasper, for each county located within GMA 14. Evidence was provided and considered that demonstrated different types of uses of groundwater, differences in historic pumping, and different

³⁵ Id.

environmental conditions that were distinguishable in the various geographic areas of GMA 14 and described conveniently by reference to the counties (a more detailed discussion of these considerations is included below in the discussion of aquifer uses and conditions in *Section* <u>5.1</u>). For these reasons, in developing proposed DFCs, District Representatives in GMA 14 found it reasonable to adopt GMA-wide DFCs, then calculate the effective DFC for each geographic area over each subdivision of the Gulf Coast Aquifer System using the political boundaries of the counties. This finding was further supported by other relevant factors considered by District Representatives in GMA 14, including:

- (1) the heavy utilization by the TWDB and the regional water planning groups in the state and regional water planning processes of information and data related to water supply and demand and other demographic information on a county-by-county basis;
- (2) the ability of the public to identify the boundaries of the geographic areas delineated; and
- (3) the ability of the GCDs—the responsible planning and regulatory entities created along county boundaries by the Texas Legislature—to achieve the DFCs, as mandated by law.

Also, as part of the joint planning process, District Representatives in GMA 14 considered impacts to private property rights and interests in groundwater, as required by Texas Water Code Section 36.108(d)(7). The Gulf Coast Aquifer System is a finite resource that replenishes at a lower rate than is required to meet all current and projected water demands. Accordingly, the consideration of impacts to private property rights necessitated the careful balancing of competing interests, such as the protection of the property rights of existing well owners (and their ability to realize their reasonable investment-backed expectations from their wells) with the protection of the property rights of other landowners (who have yet to drill water wells on their properties). The potential future harm to landowners along adjacent county lines were weighed against the real and present economic harm to existing groundwater users in certain areas of GMA 14 where groundwater levels continue to decline as demands exceed available, sustainable supplies, such as is the case in Montgomery County. In balancing all sectors, District Representatives found that the proposed DFCs were reasonable, as was establishing the average aquifer decline based on political boundaries of the counties.

Finally, the comments that suggested the proposed DFCs will result in a taking of property are not only speculative but counter to the fundamental principles in support of local groundwater management and regulation by GCDs. In Texas, the Legislature has declared GCDs as the preferred method of groundwater management.³⁶ Unlike the statewide regulation of oil and gas, local GCDs are required to manage and protect the groundwater resources within their jurisdiction pursuant to their statutory powers and duties as set forth in Texas

³⁶ See TEX. WATER CODE ANN. § 36.0015 (b)

Water Code Chapter 36 and their respective enabling legislation. The adoption of DFCs, whether GMA-wide or county-by-county, does not prevent individual GCDs from adopting different regulatory plans based on local conditions, level of demand, type of demand, frequency of demand, and communities in each GCD.

The GCDs in GMA 14 each prepared a Summary Report inclusive of all relevant comments received during the 90-day public comment period regarding the proposed DFCs, any suggested revisions to the proposed DFCS, and the basis for the revisions. The GCDs' Summary Reports were submitted to GMA 14 for further review by the District Representatives at a joint-planning meeting held October 28, 2015. At this meeting, District Representatives of GMA 14 considered and approved non-substantive changes to the proposed DFCs. The DFCs that were considered and proposed for final adoption, inclusive of all non-substantive changes, provided acceptable drawdown levels for each hydrogeologic subdivision of the Gulf Coast Aquifer System, including the Chicot, Evangeline, Burkeville, and Jasper, on two different scales—on an aquifer-wide basis for the entire geographic extent of the aquifer subdivisions in GMA 14 and on a county-by-county geographic basis, in light of the various considerations set forth above—and acceptable land subsidence levels, as applicable, for certain counties located within GMA 14. These proposed DFCs, inclusive of acceptable drawdown levels on an aquifer-wide scale and a county-by-county basis, were finally adopted by the District Representatives in GMA 14 on April 29, 2016, at a properly noticed jointplanning meeting.

In June of 2014, as required by amendments to Texas Water Code Chapter 36 resulting from passage of Senate Bill 660 in 2011, the executive administrator of the TWDB submitted the initial report on total estimated recoverable storage (TERS) to GMA 14 District Representatives. While GMA 14 District Representatives were cognizant of the enormity of this new responsibility assigned to the TWDB, significant concerns were raised during public comments and by GMA 14 District Representatives regarding the lack of usefulness of this information for two primary reasons. First, in the TWDB analysis, there were no constraints placed on the recoverability analysis due to the obvious and inevitable negative economic impacts that will result with the reduction and elimination of artesian pressures in systems like the Gulf Coast Aquifer. Based on input from GMA 14 District Representatives and technical presentations received during the 90-day public comment period, the negative economic impacts resulting from the elimination of artesian pressures from the Gulf Coast Aquifer System, a dynamic projected to occur with less than one percent of the TERS volume being produced, will clearly result in the elimination of the Gulf Coast Aquifer System as a viable water resource for almost all water use sectors. These economic impacts are, in part, driven by the negative impacts on well yields that will result with the inevitable conversion from confined to unconfined conditions as water levels are lowered due to over-pumping. The analysis provided in the TERS report to GMA 14 by the TWDB shows the calculations did not factor in either economics or hydrology. GMA 14 District Representatives strongly encourage the TWDB to conduct necessary science to better constrain future estimates of TERS, taking into consideration the negative impacts of economics and hydrology on the volumes of water that can reasonably be expected to be recovered from storage.

Another technical issue discussed by GMA 14 District Representatives was the lack of available socioeconomic impacts information directly appropriate for the joint-planning process (see *Section* <u>5.6</u> below for results of GMA 14's consideration of socioeconomic impacts). It was noted that the only consistently available quantitative socioeconomic impact analysis for water planning in Texas is the analysis of socioeconomic impacts on cities and other major water use sectors resulting from not meeting current and future water supply needs. This analysis is an outgrowth of the regional water planning process created by the passage of Senate Bill 1 in 1997³⁷ and codified in Texas Water Code Sections 16.051 and 16.053. More importantly, this analysis is performed on an ongoing basis by the TWDB and updates are provided to the 16 regional water planning groups at the conclusion of each five-year planning cycle.

This analysis executed and provided by the TWDB to the regional water planning groups is designed to answer a somewhat different question than the factor to be considered in the joint-planning process by Texas Water Code Section 36.108 (d)(6), which requires District Representatives in a GMA to consider the socioeconomic impacts reasonably expected to occur for a proposed DFC. No uniform quantitative analysis has been performed by the TWDB or any other entity to answer this specific question. There are multiple reasons for the absence of quantitative socioeconomic impact analysis. The most important being that, as GMA 14 District Representatives determined during the joint-planning process, any potential socioeconomic impacts that may occur, either positive or negative impacts, will be the result of the specifics of an individual GCD's regulatory approach to achieve the DFC, not the DFC itself. Therefore, the requirements of this element of the joint-planning process should be revisited to better clarify what is practicable with respect to the socioeconomic impacts of proposed and adopted DFCs.

Throughout the joint-planning process in GMA 14, consistent historical water use data by the primary units of the Gulf Coast Aquifer System (Chicot, Evangeline, and Jasper) was not well established. Within individual GCDs significant progress has been made in the recent past to improve the quality of water use data by aquifer. However, especially in counties without GCDs, water use data is often simply reported as "Gulf Coast Aquifer," "local aquifer" or "other" if the respondent to the TWDB's Water Use Survey is not informed as to the

³⁷ Act of June 2, 1997, 75th Leg., R.S., ch. 1010, 1997 Tex. Gen. Laws 3610.

hydrostratigraphic unit being produced by the individual well. In future joint-planning efforts, and as the Northern Gulf Coast Aquifer GAM is updated, it will be increasingly important that better resolution on pumping volumes from the discrete hydrostratigraphic units is available for model calibration.

Finally, District Representatives in GMA 14 spent considerable time and effort to encourage the participation of all counties that do not have a GCD (unprotected counties) in the joint-planning effort. Individual District Representatives contacted leaders in each of the unprotected counties to encourage their participation in the joint-planning process. While it is recognized that Chambers and Washington counties did participate throughout this round of joint planning and provided valuable insight into local issues in their respective counties, the reality is that the joint-planning process, as currently designed, suffers from the lack of any participation in the GMA 14 efforts by Jefferson, Liberty, and Orange counties. Especially with the new incentives for water project financing now available from the TWDB, the ramifications of DFCs adopted for these unprotected counties may have significant consequences in the future on municipalities in these unprotected counties. In addition, the lack of financial participation by these unprotected counties does not relieve the GMA from the responsibility of planning for the areas, thus creating a financial hardship on the GCDs in GMA 14 to meet statutory requirements for the joint-planning process in the unprotected areas. GMA 14 District Representatives support another look at this issue by future Texas Legislatures to ensure that all water users in Texas are fairly and adequately considered during future jointplanning efforts.

5.0 FACTORS CONSIDERED FOR DESIRED FUTURE CONDITIONS

Texas Water Code Section 36.108 (d)(1 – 8), require GCDs to consider the impacts of proposed DFCs on the following eight factors. The results of GMA 14 District Representatives' considerations required by Section 36.108 (d)(1–8) have been summarized below. *Table 5-1* provides a chronology for GMA 14 meetings during which each of the eight factors were formally considered. Posted meeting agendas and minutes are included in *Appendix B*.

Table 5-1 – GMA 14 schedule for discussing relevant factors related to selection of Desired Future Conditions

5.1 AQUIFER USES OR CONDITIONS

Texas Water Code Section 36.108(d)(1) requires District Representatives in a GMA to consider "aquifer uses or conditions within the management area, including conditions that differ substantially from one geographic area to another." District Representatives in GMA 14

first examined this factor on September 18, 2013 and then again on June 24, 2015. During this consideration, GMA 14 District Representatives considered aquifer uses, both historical and projected, along with historical, current, and projected aquifer conditions.

Groundwater represents a significant source of supply within GMA 14, due to its historical abundance relative to demand, easy accessibility and high quality. Access to reliable groundwater supplies has, in the past, allowed many parts of GMA 14 to avoid the development of other, more costly, alternative supplies. However, this pattern has changed over time for the more populous counties where the need for water supplies exceeded sustainable levels of groundwater production, as recognized by local GCDs and Subsidence Districts. In Harris County and the rapidly growing suburban counties like Fort Bend and Montgomery counties, municipal growth has largely driven the conversion from historically utilized groundwater supplies to alternative water supplies, primarily through the conversion to surface water sources. In other locations, such as Brazoria and Jefferson counties, non-municipal demands such as manufacturing have converted from groundwater to alternatives such as surface water and saline water supplies.

This section of the Explanatory Report focuses on historical and current use or production of groundwater for meeting demands within GMA 14. For the purposes of this analysis, data was obtained from the TWDB through their Water Use Survey³⁸ and Groundwater Database, and other sources of estimates, in order to depict the current status of groundwater pumpage in GMA 14 for the purpose of considering the balance of resource use and protection when considering proposed DFCs. Data was summarized from the years 2001 through 2011 to illustrate average conditions, absent of temporary trends in water use brought about by short-term climate effects (both droughts and above normal precipitation).

Groundwater use in GMA 14 is from a variety of aquifers that are recognized by the TWDB but are primarily related to pumpage from the Gulf Coast Aquifer System. Due to the fact that historical water use data for the Gulf Coast Aquifer System has not been consistently discretized to the individual aquifers (sometimes also referred to as formations) that make up the Gulf Coast Aquifer System, those being the Chicot Aquifer, Evangeline Aquifer, Burkeville Confining Unit, and Jasper Aquifer, for the purposes of this discussion on aquifer use, pumping estimates will be reported at the broader "Gulf Coast Aquifer System" level. As demonstrated in *Figure 5-1* and *Table 5-2* and *Table 5-3*, the Gulf Coast Aquifer System is the most significant source of groundwater supply within each county in GMA 14. In total, the Gulf Coast Aquifer System has provided 85.44 percent of the total volume of groundwater pumped in GMA 14 for the reporting period of 2007 – 2011 (*Table 5-3*). However, it should be noted that the second most significant source is reported by the TWDB as "Other/Unknown Aquifer," with

³⁸ See http://www.twdb.texas.gov/ to access TWDB Historical Groundwater Pumping Database.

13.81 percent of the total groundwater pumped for the same reporting period. This is due to the reality that historically, entities, when submitting their water use surveys to the TWDB, often do not know the specific hydrogeologic unit from which their groundwater is being produced. Alternatively, in some cases a well may be screened over multiple aquifers. As a result, the water use survey respondent will enter in "Other" as the source when not specifically known. It is generally accepted that a large share of this "Other" supply is actually Gulf Coast Aquifer System water. All of the other aquifers for which groundwater pumped is recorded in the TWDB's Water Use Survey and Groundwater Database individually represent less than one percent of the total groundwater pumped in GMA 14 for the 2007 – 2011 reporting period.

Groundwater use within GMA 14 is also dominated largely by municipal pumpage. In some counties, this is driven by the overall nature of water demands. From 2007 – 2011, average municipal groundwater pumpage accounted for 79.6 percent of total groundwater pumpage. Of this groundwater pumpage, Harris County accounts for 41.06 percent, followed by 11.40 percent in Fort Bend County and 11.36 percent in Montgomery County (Figure 5-2 and Table 5-4). However, in most counties where other demands such as manufacturing or steam-electric power generation represent a sizable portion of the overall water demand, groundwater use continues to be dominated by municipal production because of the way that these communities have evolved over time. The expansion of municipal demands throughout much of GMA 14 has been accomplished through the development of local, non-regional infrastructure including wells and small wastewater facilities. In contrast, the development of large, industrial centers has often been done in conjunction with the development of significant surface water facilities. This is an important distinction in that the historical groundwater use estimates included in this section do not include water use for the large industrial centers and steam-electric power generation facilities. Two exceptions to this trend are Jasper and Waller counties, which demonstrate manufacturing and irrigation as their primary groundwater uses, respectively. Figure 5-2 and Table 5-4 summarizes this trend throughout GMA 14.

This Explanatory Report will combine the reported "Gulf Coast Aquifer" and "Aquifer-Other" amounts as all having been produced from the Gulf Coast Aquifer.

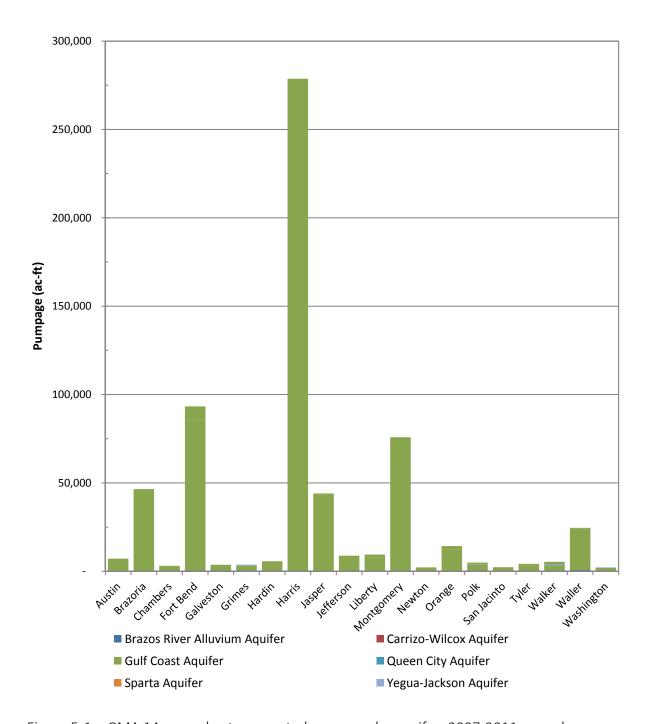

Figure 5-1 - GMA 14 groundwater reported pumpage by aquifer: 2007-2011 annual average. Gulf Coast Aquifer is combined with "other" aquifers in this graphic, as discussed above.

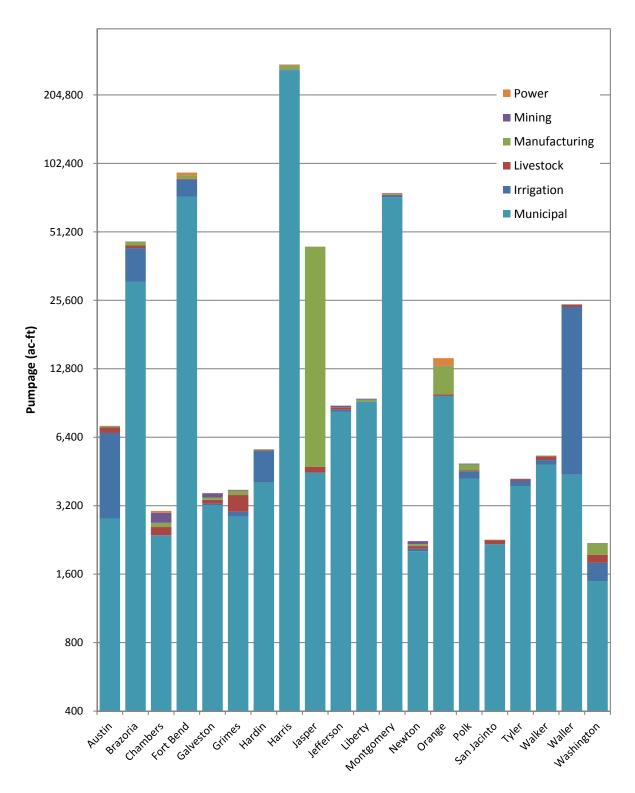

Figure 5-2 – GMA 14 groundwater pumpage by county: 2007-2011 averages.

Similarly, the same trend in municipal use from the Gulf Coast Aquifer System can be recognized throughout the extent of GMA 14. *Figure 5-3* demonstrates the portion of groundwater production originating from each aquifer by water use category.

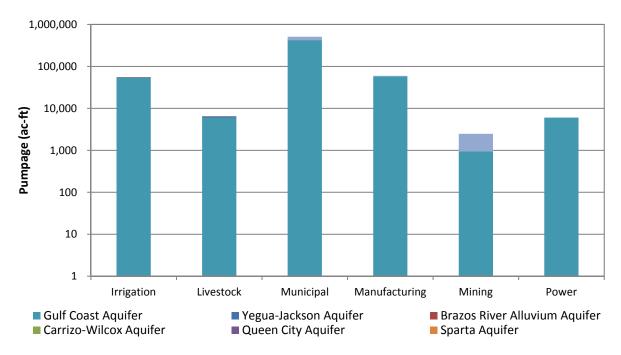

Figure 5-3 – GMA 14 groundwater pumpage reported by aquifer and use: 2007-2011 annual average

The distribution of groundwater use or pumpage throughout the Gulf Coast Aquifer System within GMA 14 is heavily centered on the historical users of groundwater throughout the region. *Figure 5-4* illustrates how this pumpage is distributed in the counties making up GMA 14. Harris County represents the largest producer of water from the aquifer, followed by Fort Bend and Montgomery counties with their rapidly expanding populations. Neighboring Brazoria and Waller counties also represent significant concentrations of groundwater usage. An exception to this pattern is within Jasper County, which represents the highest level of production and use from the Gulf Coast Aquifer among the eastern counties of GMA 14.

In establishing DFCs, GMA 14 District Representatives had discussions specific to the question of how to balance the needs of meeting current and projected water use needs with the GCD purpose statement included in Texas Water Code Section 36.001 which states, in part, "In order to provide for the conservation, preservation, protection, recharging and prevention of waste of groundwater, and of groundwater reservoirs or their subdivisions and to control subsidence caused by withdrawal of water from those groundwater resources or their

subdivisions ... groundwater conservation districts may be created as provided by this chapter." Detailed descriptions of groundwater use were included in the supporting materials presented to GMA 14 during the course of the development of DFCs. This information is presented in *Appendix G*.

The current or historic condition of an aquifer may be evaluated in a number of ways. In regions with regional-dipping, predominantly confined aquifers such as the Gulf Coast Aquifer System, the relative measurements of artesian pressures in the aquifer (measurements of artesian pressure as expressed in static water levels below land surface or above mean sea level in a well) have been determined by many GMAs in Texas to be the most effective metric for long-range planning purposes. For joint planning in GMA 14, the District Representatives reviewed contour maps of the potentiometric surface of the various aquifers within GMA 14 as a representation of current aquifer conditions. Historical pumpage, along with the natural geology of the formations, resulted in patterns of potentiometric groundwater surface elevations throughout the aquifers that vary from county to county across the GMA. The pattern of these contours was used by GMA 14 District Representatives to evaluate aquifer conditions as part of the joint-planning process.

As the primary groundwater-bearing unit within GMA 14, the Gulf Coast Aquifer System has experienced significant declines in local and regional water levels that correspond to the high levels of pumpage discussed above. In general, this is within and surrounding Harris County in the more urbanized areas of GMA 14, including Fort Bend, Galveston, and Montgomery counties. Local and regional depressions mapped on the potentiometric surfaces across the four primary formations (Chicot, Evangeline, Burkeville, and Jasper aquifers) within the Gulf Coast Aquifer System generally track the location of greatest pumpage within each

formation; the center of the cones of depression in the lower-lying layers like the Jasper Formation (Aquifer) occur north of the cones for the overlying layers like the Chicot Formation. *Figure 5-5, Figure 5-6,* and *Figure 5-7* represent both measured and simulated contours of the potentiometric surface across the Chicot, Evangeline, and Jasper formations, respectively. Contours are presented to extend the geographic extent of measured data across the entirety of the northern Gulf Coast Aquifer System and GMA 14. This data is adapted from Kasmarek, 2012³⁹. Presentation materials considered by GMA 14 District Representatives and inter-local partners are included in its entirety in *Appendix H*.

³⁹ Kasmarek, M.C., 2012, Hydrogeology and simulation of groundwater flow and land-surface subsidence in the northern part of the Gulf Coast Aquifer System, Texas, 1891–2009 (ver. 1.1, December 2013): U.S. Geological Survey Scientific Investigations Report 2012–5154, 55 p., http://dx.doi.org/sir20125154.

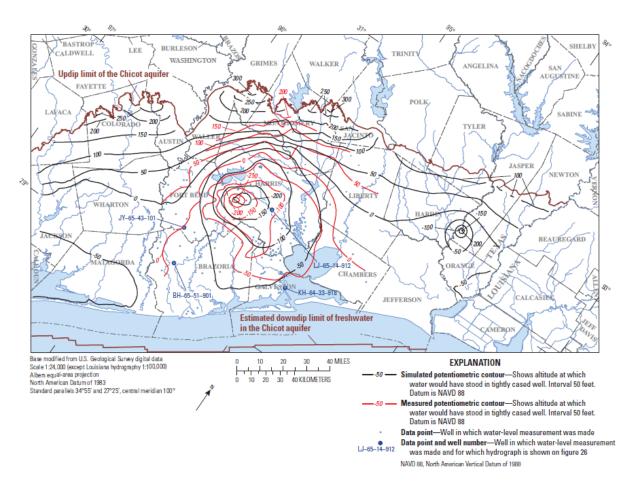

Figure 5-5 – Simulated and measured water level elevation contours in the Chicot Formation, 2009.

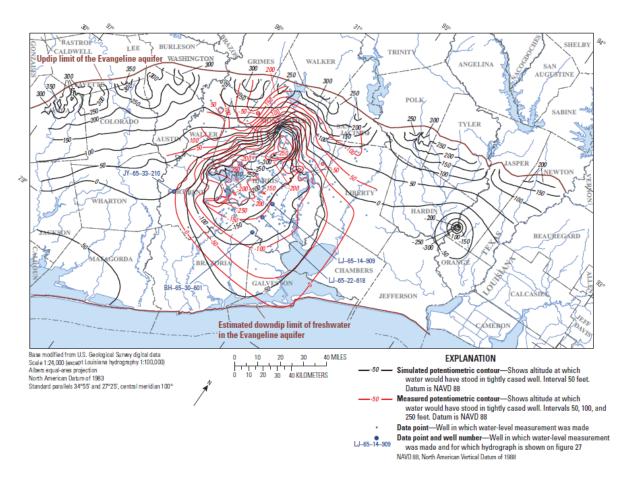

Figure 5-6 – Simulated and measured water level elevation contours in the Evangeline Formation, 2009.

In areas of high historical groundwater use, subsidence has been a significant factor related to aquifer conditions. *Figure 5-8* represents available measured and simulated data of subsidence for the Northern Gulf Coast Aquifer System. Note the high levels of historical subsidence centered in the vicinity of Harris and Galveston counties with impacts extending into neighboring areas.

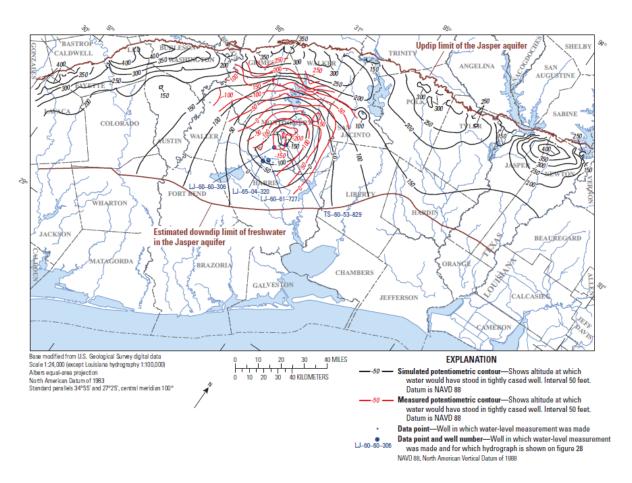

Figure 5-7 – Simulated and measured water level elevation contours in the Jasper Formation, 2009.

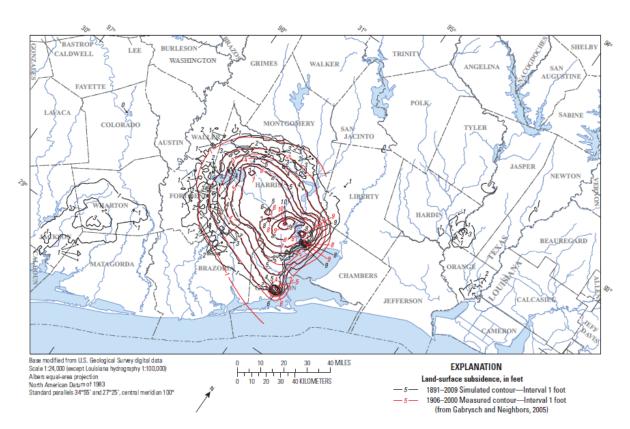

Figure 5-8 – Simulated and measured subsidence contours occurring in the Gulf Coast Aquifer System, 2009.

The dominating reliance on the Gulf Coast Aquifer System generally results in less significant patterns in conditions of other aquifers within GMA 14. *Figure 5-9* represents measured contours within the Carrizo Sand Aquifer, which crosses the northern portion of GMA 14. Significant declines in the formation are generally seen in the area north of GMA 14 where the aquifer is a more significant source of water supply. The water level elevations within GMA 14 are dictated more by geology than patterns of usage, as was demonstrated in the Gulf Coast Aquifer System. This data is taken from Dutton and others, 2003⁴⁰. Similar trends are recognized in the Queen City and Sparta Aquifers as shown in *Figure 5-10* and *Figure 5-11*, which are taken from Kelley and others, 2004⁴¹. Water level elevation data was also available for the Upper and Lower Yegua and Jackson formations from Deeds and others, 2010⁴² Water

5.2 WATER SUPPLY NEEDS AND WATER MANAGEMENT STRATEGIES

Texas Water Code Section 36.108 (d)(2), requires District Representatives in a GMA to consider the water supply needs and water management strategies included in the state water plan. In order to meet this requirement, the District Representatives in GMA 14 considered the continued population growth in the area, all water supplies needs, and recommended water

⁴⁹ Deeds, N. E., Singh, T. Y. A., Jones, T. L., Kelley, V. A., Knox, P. R., and Young. S. C., 2010, Final Report Groundwater availability model for the Yegua-Jackson Aquifer: Final Technical Report prepared for the Texas Water Development Board, 582 p.

management strategies included in the 2011 regional water plans⁵⁰ and the 2012 State Water Plan.⁵¹ Applicable information for this factor is included in its entirety in *Appendix I*.

GMA 14 is centered over one of the most diverse, demographically dynamic regions of the State of Texas. Although the 20 counties making up GMA 14 represent less than 10 percent of the land mass of Texas, the approximately 6,529,891 people living in the area of GMA 14 in 2010 (see Table 5.5) represent 25.7 percent of the State's total population, and over the 50year planning horizon, GMA 14 is projected to increase to 11,958,683 people, representing an 83 percent increase in the population in the region. A review of the individual county population projections, however, documents that this distribution of population in GMA 14 is not uniform throughout the area. Harris County is the most populous county in GMA 14 (and the most populous county in Texas) with 4,078,231 people in 2010, followed by Fort Bend, and Montgomery counties with 550,121 and 453,369 people, respectively (see Table 5.5)). Fourteen of twenty counties in GMA 14 recorded populations of less than 100,000 people in 2010, with the two least-populous counties in GMA 14, Newton and Tyler counties, recording 16,008 and 24,744 people, respectively. During the joint-planning process District Representatives paid close attention to both current and projected population projections, both in urban and rural areas. In GMA 14, this examination of current and projected population highlights the significant differences that exist between urban and rural demographics. This difference, especially with respect to municipal water use, is widely variable in GMA 14.

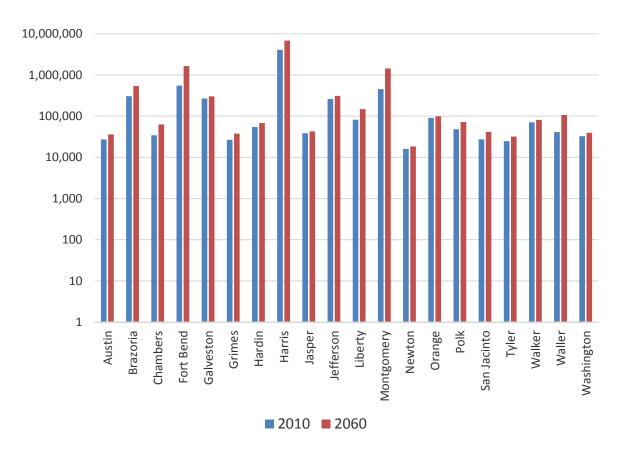

Figure 5-16 – Population projections by county for GMA 14. Population projections are for 2010 and 2060. Note, scale of this graphic is logarithmic in order to document populations in less populated counties.

In Texas, the overall "water needs" for a region, as defined within the Texas State Water Plan, are the demands (based on water demand projections developed during the water-planning process for 6 major water use sectors) that cannot be met with existing supplies. These existing supplies may be inadequate to satisfy demands because of natural conditions (e.g., sustainable supply of an aquifer or firm yield of a reservoir) or infrastructure limitations (e.g. inadequate diversion, treatment, or transmission capacity). A review of the future water management strategies within a region gives some insight into the potential future supply to meet an identified need. Therefore, future groundwater management strategies identified in the 2012 Texas State Water Plan indicate the potential future demand for groundwater in addition to currently utilized supplies.

GMA 14 comprises an area spanning Regional Water Planning Areas G (Brazos G), H, and I (East Texas). Data from the 2012 Texas State Water Plan for each of these regions was used to develop data summaries for consideration by the GMA 14 District Representatives and

interlocal agreement partners. *Figure 5-17* illustrates the growth of total demands and needs (demands not met by existing supplies) within GMA 14 for the three regional water planning areas (G, H, and I). The columns in this figure demonstrate the availability of existing groundwater and other water (surface water, reuse, conservation) supplies in dark and light blue colors, respectively. Future water management strategies based on groundwater and other water supplies are shown in dark and light red colors, respectively. Generally, it can be seen in this figure that the majority of future water supplies will originate from sources other than groundwater supplies and that this ratio of new groundwater supplies to other options will be far below that currently making up existing regional water supplies.

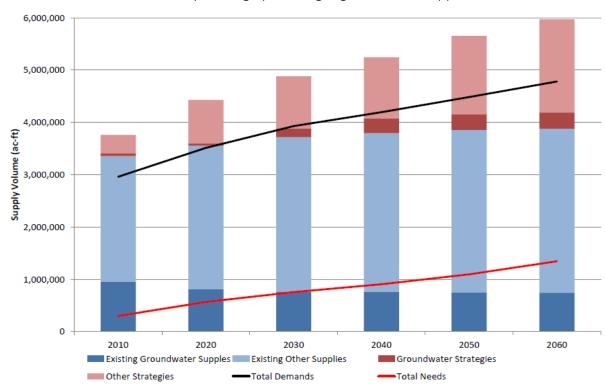

Figure 5-17 – Projected supplies and strategies from the 2012 Texas State Water Plan

The trend toward other water supplies in lieu of expanded groundwater continues at the county level of all counties anticipating significant need for additional water supplies over the course of the planning horizon (*Figure 5-18*).

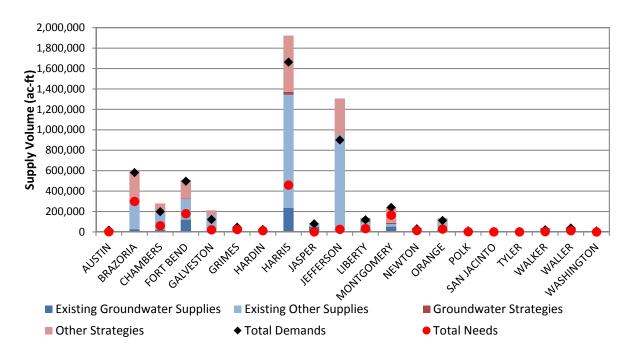

Figure 5-18 – Projected year 2060 supplies and strategies from the 2012 State Water Plan

5.3 HYDROLOGICAL CONDITIONS

Texas Water Code Section 36.108 (d)(3) requires District Representatives in a GMA to consider hydrological conditions, including for each aquifer in the management area the total estimated recoverable storage (TERS) as provided by the executive administrator, and the average annual recharge, inflows, and discharge. As part of the joint-planning process, District Representatives in GMA 14 reviewed and considered estimates of TERS, inflows, outflows, recharge, and discharge for all relevant aquifers based on results from the most recently adopted groundwater availability models (GAMs) and technical assessments from the TWDB. The principal GAM utilized in this analysis was the Northern Gulf Coast Groundwater Availability Model or Northern Gulf Coast GAM. Estimates of TERS were provided by the TWDB executive administrator for review and consideration during the joint-planning process, as required by statute. The technical materials focused on hydrological conditions, including estimates of TERS, inflows, outflows, recharge, and discharge for all relevant aquifers, presented and considered by the District Representatives in GMA 14, are included in their entirety in *Appendix J*.

The hydrostratigraphy utilized in the Northern Gulf Coast GAM for the Gulf Coast Aquifer System is documented in the following *Figure 5-19*. Of the five hydrostratigraphic units utilized in construction of the Northern Gulf Coast GAM, the Chicot, Evangeline, and Jasper aquifers are recognized as the primary water-bearing resources in GMA 14.

Although this section is focused on the consideration of hydrological conditions, it is noted, however, that there are no significant differences between this requirement in Texas Water Code Section 36.108 (d)(3) and the requirements contained in Texas Water Code Section 36.108 (d)(1) to consider "aquifer uses or conditions within the management area, including conditions that differ substantially from one geographic area to another," at least with respect to "hydrologic conditions." As discussed in Section 5.1 above, there are several ways to express and evaluate hydrological conditions in an aquifer. As discussed in Section 5.4, hydrologic conditions may be evaluated based on spring flows, the volume of water remaining in storage in areas of unconfined conditions, the measurements of artesian pressures in the aquifer in regional-dipping and predominantly confined aquifers, and in certain coastal areas on levels of land-surface subsidence. As discussed in Section 5.1 and in Figure 5-5 through Figure 5-15 above, GMA 14 District Representatives reviewed contour maps of the potentiometric surface of the various aquifers within GMA 14 as a representation of current aquifer/hydrologic conditions. Historical pumpage, along with the geology of the formations, have resulted in patterns of potentiometric (water) surface elevations throughout the aquifers that vary from county to county across the GMA. The pattern of these contours was used by GMA 14 District Representatives to evaluate aquifer/hydrologic conditions as part of the joint-planning process.

G	eologic (stratig	Hydrogeologic units	Model

⁵⁴ Wade, S., Thorkildsen, D., and Anaya, R., 2014, GAM Task 13-037: Total estimated recoverable storage for aquifers in Groundwater Management Area 14: Texas Water Development Board, 35 p.

those estimates on proposed DFCs. For a more detailed reference to these discussions, the reader is referred to the meeting minutes included in *Appendix B*. The TERS report prepared and provided by the TWDB is reproduced in its' entirety in *Appendix K*. TERS volumes, in acrefeet, for GMA 14 for the Gulf Coast Aquifer System, based on this report is 2,776,000,000 acrefeet. *Figure 5-20* provides a county by county comparison of the TERS values included in Wade and others, 2014).

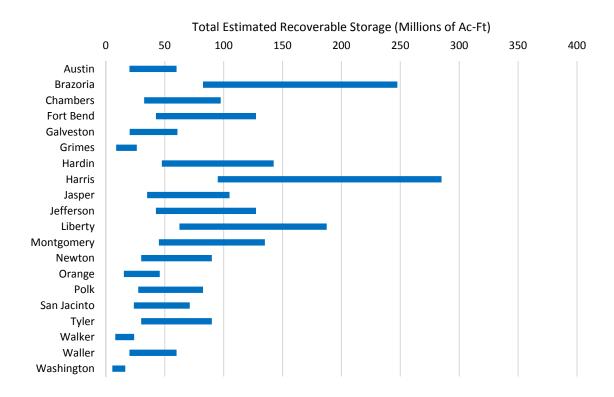

Figure 5-20 —Total Estimated Recoverable Storage by county

Following release of the initial TERS report by the TWDB, the estimates were again provided to GMA 14 by the TWDB in a slightly different format, wherein estimates are divided into unconfined and confined storage. The following graphic (*Figure 5-21*) is taken from Wade and others (2014) and is reproduced here to illustrate the differences in confined and unconfined storage. *Table 5-6* and *Table 5-7* include the additional breakdowns of TERS into confined and unconfined storage provided by the TWDB. One of the more notable conclusions that GMA 14 District Representatives made with regards to the TERS data was that while the Gulf Coast Aquifer System in GMA 14, as reported by the TWDB in Table 5.7, contains 2,776,000,000 acrefeet in total storage, only 10,952,354 acre-feet, equivalent to 0.39 percent, is in confined storage.

Southeast Texas GCD	560,889,946	4,467,294	570,000,000	142,500,000	427,500,000
Total	2,756,914,613	10,952,354	2,780,000,000	695,000,000	2,085,000,000

Note: The total estimated recoverable storage values by groundwater conservation district and county for an aquifer may not be the same because the numbers have been rounded to two significant digits.

In addition to the consideration of TERS, GMA 14 District Representatives also considered the water budgets for each aquifer in GMA 14, including recharge from land surface (as quantified by General Head Boundary in the Northern Gulf Coast Aquifer GAM), pumpage, lateral inflows, leakage to an upper unit, leakage from an upper unit, leakage to a lower unit, leakage from a

⁵⁶ Data provided via email communication from Cindy Ridgeway, TWDB, to Kathy Turner Jones, Lone Star GCD, dated August 19, 2015, regarding additional information pertaining to confined and unconfined TERS in GMA 14.

lower unit, discharge to the surface (as quantified by General Head Boundary in the Northern Gulf Coast Aquifer GAM), and lateral outflows. An example of the county/aquifer specific water budgets for Austin County is included below in *Figure 5-22*. In Austin County, the volumetrically dominant aquifer is the Evangeline Aquifer. Other observations from this illustration of the water budgets in Austin County include (1) pumping from the Chicot Aquifer is a very small part of the water budget, (2) recharge to the Chicot Aquifer from land surface is almost equal to the amount of leakage from the Chicot Aquifer to the Evangeline Aquifer, and (3) lateral inflows in to the Chicot Aquifer in Austin County are almost twice the lateral inflows into the Evangeline Aquifer. Similarly prepared water budgets for the remaining 19 counties in GMA 14 are presented in *Appendix L*.

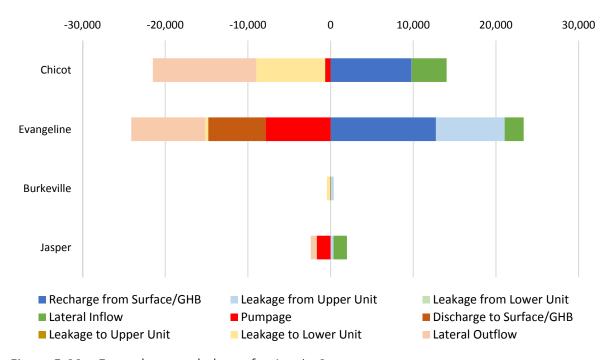

Figure 5-22 – Example water balance for Austin County

Estimates of TERS, water budgets, and aquifer conditions (based on potentiometric surface maps) for the minor aquifers in GMA 14 were also considered by the District Representatives. This information is included in *Appendix K* and *Appendix L*. However, since all minor aquifers in GMA 14 have been declared as non-relevant for joint-planning purposes (see *Section 0* below), no further discussion of these minor aquifers is included in this section focused on the consideration of hydrological conditions in GMA 14.

Throughout the later stages of the GMA 14 joint-planning efforts, significant comments were received from stakeholders with regards to the appropriate role that the estimates of TERS should have in establishing DFCs. A more detailed discussion on these comments is provided in Section 8.0 of this Explanatory Report. As stated therein, the GMA 14 District

Representatives carefully weighed all comments received on the issue of TERS and ultimately decided, for a number of reasons, that due to other considerations, in particular the negative socioeconomic impacts of subsidence, TERS has no practical application in the GMA 14 joint-planning process or in groundwater management of the Gulf Coast Aquifer System.

5.4 FNVIRONMENTAL FACTORS

Texas Water Code Section 36.108 (d)(4) requires District Representatives in a GMA to consider environmental impacts, including impacts on spring flow and other interactions between groundwater and surface water. This requirement was met by reviewing applicable scientific literature including information contained in scientific literature published for relevant aquifers in GMA 14. In addition, environmental issues presented in applicable 2011 regional water plans were also considered. Information presented and considered by GMA 14 District Representatives on this factor is included in its entirety in *Appendix M*.

The primary focus of this factor was on surface water – groundwater interaction. After a review of available literature, in particular Kasmarek (2012)⁵⁷, it was determined that there is insignificant interaction between surface water bodies (streams, rivers, and lakes) and aquifers in the Northern Gulf Coast Aquifer System. As a result, there is no significant surface water/groundwater interaction modeled in the Northern Gulf Coast GAM utilizing the MODFLOW "stream package." Consequently, there is no tool available to provide any quantitative analysis of the interaction between surface water and groundwater for the Gulf Coast Aquifer system. As part of the considerations made by GMA 14 District Representatives, however, it was noted that groundwater and surface water interaction occurs on a very limited basis, based on USGS and TWDB studies. In addition, Lower Colorado River Authority studies conducted to the southwest of GMA 14 have shown that surface water and groundwater interaction is limited to the shallow groundwater system and the Colorado River, and that similar conditions could occur in GMA 14.

5.5 SUBSIDENCE

Texas Water Code Section 36.108 (d)(5) requires District Representatives in a GMA to consider the impacts of proposed desired future conditions on subsidence. The impact of proposed DFCs on subsidence are clearly more significant in GMA 14 than in any other GMA in Texas. The importance of subsidence, and more importantly, the prevention of future subsidence, is illustrated in *Figure 5-8*, which illustrated actual measured subsidence in the Harris and Galveston areas greater than 10 feet from 1906 - 2000. District Representatives spent

⁵⁷ Kasmarek, M.C., 2012, Hydrogeology and simulation of groundwater flow and land-surface subsidence in the northern part of the Gulf Coast Aquifer System, Texas, 1891–2009 (ver. 1.1, December 2013): U.S. Geological Survey Scientific Investigations Report 2012–5154, 55 p., http://dx.doi.org/sir20125154.

considerable time reviewing scientific studies on subsidence in GMA 14, including results from the recently completed update to the Northern Gulf Coast GAM with a focus on the subsidence package developed as part of this model update (see Kasmarek, 2012⁵⁸, and Freese & Nichols and others, 2012⁵⁹). Additional technical resources utilized by GMA 14 District Representatives during their consideration of potential impacts of proposed DFCs included Kasmarek and Robinson, (2004)⁶⁰, Coplin and Galloway, (1999)⁶¹, Holzschuh, (1991)⁶², Jones and Larson (1975)⁶³, Harris-Galveston Subsidence District (2014)⁶⁴, and Campbell and others (2014)⁶⁵. The presentation on impacts of proposed DFCs on subsidence is included in its' entirety in *Appendix N*. This presentation on subsidence in GMA 14 generally focused on predictions of subsidence utilizing PRESS model results for Harris, Galveston, and Fort Bend counties, and utilizing the Northern Gulf Coast GAM Run 2 (SUB package) for the remainder of GMA 14.

Prediction of Effective Stress and Subsidence ("PRESS") model predictions of subsidence (Freese & Nichols and others, 2012), as illustrated in *Figure 5-23*, for the period of 2010 – 2070, indicate that more than 3.25 feet of future subsidence will occur in the Arcola area of Fort Bend County, followed by more than 2.25 feet and 1.75 feet of future subsidence in the Katy area and Laughlin Creek area in Harris County, respectively. It is noted that the PRESS model results were limited to areas where PRESS model sites exist, mostly within the Subsidence Districts. At this point in time, no areas other than the Subsidence Districts have PRESS models.

⁵⁸ Kasmarek, M.C., 2012, Hydrogeology and Simulation of Groundwater Flow and Land-Surface Subsidence in the Northern Part of the Gulf Coast Aquifer System, Texas, 1891–2009: Scientific Investigations Report 2012–5154, Version 1.1, 55 p.

⁶⁵ Campbell, M. D., Wise, H. M., and Bost, R. C., 2014, Growth faulting and subsidence in the Houston, Texas Area: Guide to the origins, relationships, hazards, potential impacts and methods of investigation: Published for the Graduates and Members of The Institute of Environmental Technology, Houston, Texas, The Houston Geological Society, and, The American Institute of Professional Geologists, 102 p.

The SUB package in the Northern Gulf Coast GAM was utilized for the rest of the GMA 14. Based on results from the Northern Gulf Coast GAM Run 2 utilizing the SUB package, average predictions of subsidence on a county basis range from 0.0 feet for Grimes, Polk, Walker, and Washington counties to 0.5 feet for Austin, Liberty, and Montgomery counties and 0.7 feet in Brazoria County (*Figure 5-24* and *Figure 5-25*).

The economic impacts of subsidence are a priority public policy issue in the areas included in GMA 14, in large part due to the catastrophic economic impacts that result from significant land surface subsidence. During considerations of the impacts of proposed DFCs on subsidence, District Representatives and inter-local agreement partners discussed a number of factors impacting subsidence. Groundwater use resulting in groundwater-level declines in the Gulf Coast Aquifer System results in land surface subsidence and increased movement along growth faults in the Texas Gulf Coast. Groundwater-level decline, subsidence, and faulting are inter-related in the Gulf Coast Aquifer System, all having the potential for an adverse economic impact (Campbell and others, 2013⁶⁶). Jones and Larson (1975⁶⁷) estimated the cost associated with land subsidence in about a 900 mi² area including a small portion of Harris County and some shoreline in Galveston County to be about \$32 million (about \$150 million in 2015) annually. When looking at the financial impacts for repairing 165 homes along 3 fault zones, costs exceed \$2.7 million dollars, not including damage to public infrastructure, which would have been far greater (Campbell and others, 2013). Coplin and Galloway (1999⁶⁸) and Holzschuh (1991⁶⁹) suggested that subsidence-damage estimates just along the Houston Ship Channel refineries were in the range of \$340 million (1998 dollars) while damage requiring repairs and re-construction to industry-wide infrastructure likely amounted to billions of dollars (as of 1998) (Campbell and others, 2013). Considering the magnitude of population growth over the last decade and the associated increased water demand, public infrastructure, and new development, the economic impact of subsidence in the GMA 14 region is most certainly in the billions of dollars.

Based on these considerations, subsidence is clearly one of the most important factors to take into account when establishing DFCs. Unique to GMA 14, DFCs specific to land subsidence were adopted for 7 of the 20 counties making up the GMA. While DFCs specific to every county in GMA 14 were not adopted, clearly, the impact of projected groundwater use was considered in the adopted DFCs for the Gulf Coast Aquifer System in GMA 14.

5.6 SOCIOECONOMICS

Texas Water Code Section 36.108 (d)(6) requires District Representatives in a GMA to consider socioeconomic impacts reasonably expected to occur as a result of the proposed desired future conditions for relevant aquifers. Consideration of socioeconomic impacts as part of water planning in Texas, both at the regional and state level, has been a fundamental element of the planning process dating back to the 1990s. Texas Water Code Section 16.051 (a) states that the TWDB "shall prepare, develop, formulate, and adopt a comprehensive state water plan that . . . shall provide for . . . further economic development." A companion provision in Texas Water Code Section 16.053 (a) and (b) creates a similar requirement for regional water planning groups that regional water plans "further economic development." Title 31 of Texas Administrative Code, Section 357.7 (4)(A) states, "The executive administrator shall provide available technical assistance to the regional water planning groups, upon request, on water supply and demand analysis, including methods to evaluate the social and economic impacts of not meeting needs." This technical assistance and analysis provided by the executive administrator is the only consistent analysis of socioeconomic impacts available for jointplanning in regards to socioeconomic impacts, both at the local, regional, and state level. Title 31 of Texas Administrative Code, Section 357.40(a) states that regional water plans "shall include a quantitative description of the socioeconomic impacts of not meeting the identified water needs pursuant to §357.33(c) of this title (relating to Needs Analysis: Comparison of

Water Supplies and Demands)." This analysis, executed by the executive administrator at the TWDB, is performed at the request of the individual regional water planning groups and is based on water supply needs from the regional water plans. This analysis consists of a series of point estimates of 1-year droughts at 10-year intervals. The socioeconomic impact analysis attempts to measure the impacts in the event that water user groups do not meet their identified water supply needs associated with a drought of record for one year. For this socioeconomic impact analysis, multiple impacts are examined, including (1) sales, income, and tax revenue, (2) jobs, (3) population, and (4) school enrollment. Results from this analysis are then incorporated into the final regional water plan, and then comprehensively presented in the subsequent state water plan.

Information regarding socioeconomic impacts reasonably expected to occur as a result of the proposed DFCs presented to GMA 14 District Representatives is included in its entirety in Appendix O. As part of the GMA 14 District Representatives' considerations of socioeconomic impacts reasonably expected to occur as a result of the proposed DFCs for relevant aquifers in GMA 14, the socioeconomic impact analysis provided by the Texas Water Development Board to Brazos G⁷², Region H⁷³, and East Texas⁷⁴ regional water planning groups for the 2011 regional water plans were considered. These technical memoranda are included in their entirety as Appendix P, Appendix Q, and Appendix R, respectively. To illustrate the regional impacts of not meeting water supply needs, examples for specific water user groups for each of the three regional water planning areas (G, H, and I) along with regional summaries for Region H were presented. Figure 5-26 and Figure 5-27 illustrate the socioeconomic impacts of not meeting water supply needs in Region H based on the 2011 Region H Regional Water Plan. An example of the significance of not meeting future water supply needs is illustrated in *Figure* 5-26 in which lost income in 2060 will be almost \$19 billion annually for Region H if water supply needs identified in the 2011 Region H Regional Water Plan are not met. Similarly, Figure 5-27 illustrates that there will be a loss of more than 170,000 people in Region H if projected water supply needs are not met.

⁷² Norvell, S. D., and Shaw, S. D. 2010, Socioeconomic Impacts of Projected Water Shortages for the Brazos G Regional Water Planning Area (Region G) Prepared in Support of the 2011 Brazos G Regional Water Plan: Texas Water Development Board, 60 p.

⁷³ Norvell, S. D., and Shaw, S. D. 2010, Socioeconomic Impacts of Projected Water Shortages for the Region H Regional Water Planning Area: Prepared in Support of the 2011 Region H Regional Water Plan: Texas Water Development Board, 73 p.

⁷⁴ Norvell, S. D., and Shaw, S. D., 2010, Socioeconomic Impacts of Projected Water Shortages for the East Texas Regional Water Planning Area (Region I), Prepared in Support of the 2011 East Texas Regional Water Plan: Texas Water Development Board, 45 P.

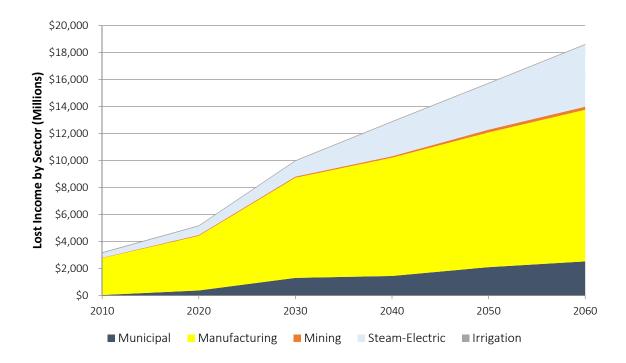

Figure 5-26 – Estimates of lost income due to not meeting water supply needs by water use sector over the 50-year planning horizon (2010-2060) for Region H based on analysis provided by TWDB

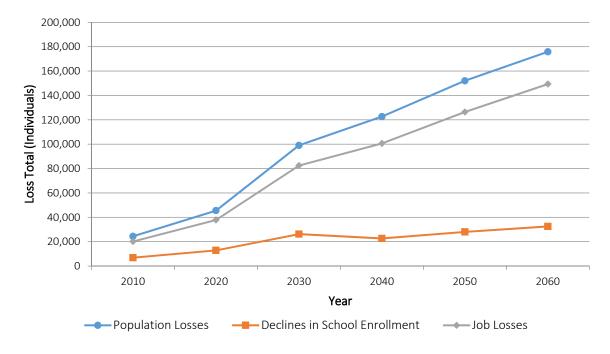

Figure 5-27 – Estimates of population losses, declines in school enrollment, and job losses over the 50-year planning horizon (2010-2060) due to not meeting water supply needs by water use sector for Region H based on analysis provided by TWDB

The primary source of quantitative information considered by GMA 14 as part of the jointplanning process was information on the socioeconomic impacts of not meeting water supply needs as quantified in the applicable 2011 Regional Water Plans and the 2012 Texas State Water Plan. GMA 14 District Representatives also considered the socioeconomic impacts of proposed DFCs. These considerations were somewhat different from the socioeconomic impacts resulting from not meeting water supply needs for two primary reasons. First, a standardized local or regional socioeconomics analytical tool has not been developed for the joint-planning process as is the case for the regional water supply planning process in Texas. Clearly, the development of a similar tool for the joint-planning process is well beyond the intent of the joint-planning process amended by Senate Bill 660 in 2011. Second, the nature of socioeconomic impacts from proposed DFCs is unique from one GCD to another within a common groundwater management area in that two or more GCDs may share a common DFC, but the communities within the GCDs differ widely—inevitably resulting in differences in socioeconomic impacts. The GCDs in GMA 14 vary from almost entirely urban to almost entirely rural farming areas. As such, a quantitative analysis of socioeconomic impacts for proposed DFCs in the joint-planning process is not practical.

Instead, GMA 14 District Representatives had discussions of qualitative socioeconomic impacts that may result from proposed DFCs. These impacts were both positive and negative, depending on the timing of the consideration. The following is a summary list of socioeconomic impacts considered by GMA 14 District Representatives.

- Proposed DFCs may require conversion to alternative water supply, which may have increased costs associated to infrastructure, operation, and maintenance.
- Proposed DFCs may reduce/eliminate the costs of lowering pumps and either drilling or deepening of wells.
- Proposed DFCs may reduce/eliminate the costs associated with subsidence (including legal costs assigned to parties determined to be liable).
- Proposed DFCs may serve to sustain/enhance economic growth due to assurances provided by diversified water portfolio.
- Alternatives to proposed DFCs may result in short-term reduction in utility rates due to reduction in cost of water management strategy implementation.
- Alternatives to proposed DFCs may result in significant but unquantified production costs due to transition from confined to unconfined conditions in local aquifers.
- Alternatives to proposed DFCs may result in either an increase or reduction of production costs due to positive or negative changes in water quality.

As part of the 90-day public comment period and public hearings held by the five GMA 14 GCDs, a comment was received highlighting one additional study of socioeconomic impacts related to changing water levels in Lake Conroe in Montgomery County. In this study (Rogers

and others, 2012⁷⁵) the local socioeconomic impacts projected to result from fluctuating water levels in Lake Conroe are presented. This study was considered by the Lone Star GCD during their proposed DFC hearing on September 18, 2015 and by GMA 14 District Representatives at the October 28, 2015 joint-planning meeting.

Another technical issue discussed by GMA 14 District Representatives was the lack of available socioeconomic impacts information directly appropriate for the joint-planning process (see *Section 5.6* below for results of GMA 14's consideration of socioeconomic impacts). It was noted that the only consistently available quantitative socioeconomic impact analysis for water planning in Texas is the analysis of socioeconomic impacts on cities and other major water use sectors resulting from not meeting current and future water supply needs.

The analysis executed and provided by the TWDB to the regional water planning groups is designed to answer a somewhat different question than the factor to be considered in the joint-planning process by Texas Water Code Section 36.108 (d)(6), which requires District Representatives in a GMA to consider the socioeconomic impacts reasonably expected to occur for proposed DFCs. No uniform quantitative analysis has been performed by the TWDB or any other entity to answer this specific question. There are multiple reasons for this absence of quantitative socioeconomic impact analysis. The most important reason is that, as GMA 14 District Representatives determined during the joint-planning process, any potential socioeconomic impacts that may occur, either positive or negative impacts, will be the result of the specifics of an individual GCD's regulated community and the regulatory approach taken by that GCD to achieve the DFC, not the DFC itself. Therefore, the requirements of this element of the joint-planning process should be revisited to better clarify what is practicable with respect to the socioeconomic impacts of proposed and adopted DFCs.

5.7 PRIVATE PROPERTY RIGHTS

Texas Water Code Section 36.108(d)(7) requires that District Representatives in a GMA consider the impact of proposed DFCs on the interests and rights in private property, including ownership and the rights of management area landowners and their lessees and assigns in groundwater, as recognized under Texas Water Code Section 36.002. GMA 14 District Representatives formally considered this factor during joint-planning meetings on September 23, 2014, June 24, 2015, and October 28, 2015. The presentation materials utilized by GMA 14 District Representatives are included in their entirety in *Appendix S*. While GMA 14 District Representatives invested significant time during these three meetings on the impacts of

⁷⁵ Rogers, G. O., Moore, G. W., Saginor, J., Brody, S. D., Burns, G. R., Jithitikulch, T., and Young, T., 2012, Impact of Lake-Level Reductions on Lake Conroe Area, Lake Area Property Values, Property Tax Revenues and Sales Tax Revenues: Contract report prepared for Montgomery County by Texas A & M University, 54 p.

proposed DFCs on private property rights, it is understood that the impacts of proposed DFCs on private property rights has truly been an overarching consideration throughout the joint-planning process. Each District Representative provided input to GMA 14 on not only the impacts of proposed DFCs, but also how individual GCD management plans and rules have been developed to achieve current DFCs (adopted in August 2010) while protecting private property rights. GCDs must consider all private property rights when considering management plans, rules, and permit decisions. GCDs must balance the interests of historic groundwater users, landowners who desire to preserve the aquifer levels beneath their property, and property owners who may be damaged by either groundwater-level declines or subsidence. The DFCs attempt to strike a balance between all of these property interests.

For a more complete record of these discussions, see the approved GMA 14 meeting minutes for the April 29, 2016, GMA 14 meeting (included in *Appendix B*). While the approach to protecting private property rights varies somewhat from GCD to GCD in GMA 14, depending upon local conditions, it is recognized that in addition to the proposed DFCs, all GCDs in GMA 14 have developed management plans and rules that fundamentally work to protect private property rights.

For reference, Texas Water Code Section 36.002 reads as follows:

- a) The legislature recognizes that a landowner owns the groundwater below the surface of the landowner's land as real property.
- b) The groundwater ownership and rights described by this section:
 - 1) entitle the landowner, including a landowner's lessees, heirs, or assigns, to drill for and produce the groundwater below the surface of real property, subject to Subsection (d), without causing waste or malicious drainage of other property or negligently causing subsidence, but does not entitle a landowner, including a landowner's lessees, heirs, or assigns, to the right to capture a specific amount of groundwater below the surface of that landowner's land; and
 - 2) do not affect the existence of common law defenses or other defenses to liability under the rule of capture.
- c) Nothing in this code shall be construed as granting the authority to deprive or divest a landowner, including a landowner's lessees, heirs, or assigns, of the groundwater ownership and rights described by this section.
- *d)* This section does not:
 - 1) prohibit a district from limiting or prohibiting the drilling of a well by a landowner for failure or inability to comply with minimum well spacing or tract size requirements adopted by the district;

- 2) affect the ability of a district to regulate groundwater production as authorized under Section 36.113, 36.116, or 36.122 or otherwise under this chapter or a special law governing a district; or
- 3) require that a rule adopted by a district allocate to each landowner a proportionate share of available groundwater for production from the aquifer based on the number of acres owned by the landowner.
- e) This section does not affect the ability to regulate groundwater in any manner authorized under:
 - 1) Chapter 626, Acts of the 73rd Legislature, Regular Session, 1993, for the Edwards Aquifer Authority;
 - 2) Chapter 8801, Special District Local Laws Code, for the Harris-Galveston Subsidence District; and
 - 3) Chapter 8834, Special District Local Laws Code, for the Fort Bend Subsidence District.

While this provision of the Texas Water Code Section 36.002 was substantively amended to its current scope with the passage of Senate Bill 660 by the Texas Legislature in 2011⁷⁶, the spirit of this section has been at the core of groundwater laws since passage of House Bill 162 by the Texas Legislature in 1949⁷⁷. GMA 14 District Representatives ultimately based the adopted DFCs on a balancing of private property rights, for both current and future users, as exemplified in each GCDs management plan and rules.

5.8 FEASIBILITY OF ACHIEVING THE PROPOSED DESIRED FUTURE CONDITIONS

Texas Water Code Section 36.108 (d)(8) requires District Representatives in a GMA to consider the feasibility of achieving the proposed desired future condition(s). This requirement was added to the joint-planning process with the passage in 2011 of Senate Bill 660 by the 82nd Texas Legislature⁷⁸. However, this review concept actually dates back to the rules adopted by the Texas Water Development Board (TWDB) in 2007 to provide guidance as to what would be considered by the TWDB during a petition process regarding the reasonableness of an adopted DFC. In these rules, the TWDB required that an adopted DFC must be physically possible from a hydrological perspective. During the first round of joint planning, the TWDB definition for DFCs included in Title 31, Texas Administrative Code, Section 356.2 (8) was "The desired, quantified condition of groundwater resources (such as water levels, water quality, spring flows, or volumes) for a specified aquifer within a management area at a specified time

⁷⁶ Act of May 29, 2011, 82nd Leg., R.S., ch. 1233, 2011 Tex. Gen. Laws 3287.

⁷⁷ Act of May 23, 1949, 51st Leg., R.S., ch. 306, 1949 Tex. Gen. Laws 559.

⁷⁸ Act of May 29, 2011, 82nd Leg., R.S., ch. 1233, 2011 Tex. Gen. Laws 3287.

or times in the future, through at least the period that includes the current planning period for the development of regional water plans pursuant to §16.053, Texas Water Code, or in perpetuity, as defined by participating groundwater conservation districts within a groundwater management area as part of the joint-planning process. Desired future conditions have to be physically possible, individually and collectively, if different desired future conditions are stated for different geographic areas overlying an aquifer or subdivision of an aquifer."

In addition, in these original rules, Title 31, Texas Administrative Code Section 356.34 (1) stated the following: "Submission Package - Districts must include the following when submitting an adopted desired future condition to the board:(1) the desired future condition of the aquifer in the groundwater management area (multiple desired future conditions for the same aquifer in a groundwater management area need to be physically compatible)."

Upon passage of Senate Bill 660 in 2011, the TWDB made significant revisions to the rules contained in Title 31, Texas Administrative Code, Chapter 356 to be consistent with requirements and terminology added and revised by the new statutes. During this process, the reference to the need for a DFC to be physically possible or physically compatible was removed, under the rationale that the reference to consideration of feasibility of achieving a DFC included in Texas Water Code Section 36.108 (d) (8) equated to a DFC being physically possible or physically compatible.

During the TWDB's review of multiple petitions regarding the reasonableness of adopted DFCs in groundwater management areas from 2010 - 2011, the evaluation of whether or not an adopted DFC was physically possible was based on whether or not the DFC(s) could reasonably be simulated using the TWDBs adopted groundwater availability model for the aquifer(s) in question. This was a valid approach because if an adopted DFC was not physically possible, then under the physical laws of hydrology, as incorporated in the mathematical calculations executed during model simulations, the model would not execute the prescribed simulation successfully.

There have been and continue to be many potential DFC scenarios considered in GMAs across Texas that are not physically possible. One example is GMA 9, where petitions filed in 2009 challenged DFCs approved for the Edwards Group of the Edwards Trinity (Plateau) Aquifer. Following a hearing, the TWDB determined the DFC for Kerr County to be unreasonable because more than 100% of the available MAG would be produced through exempt-use wells making it unfeasible to achieve the adopted DFC.⁷⁹

-

⁷⁹ http://www.twdb.texas.gov/groundwater/petitions/doc/GMA9/2009_Petitions/TWDB_Staff_Report_GMA9_Petitions_01-10.pdf

The DFCs and resulting estimates of modeled available groundwater initially presented during the June 24, 2014 GMA 14 meeting, referred to as the Northern Gulf Coast GAM Run 2, and utilized throughout the remainder of the joint-planning process in GMA 14, were successfully simulated and corresponding estimates of modeled available groundwater were produced. Therefore, utilizing the approach taken by the TWDB during the first round of joint planning that concluded on September 1, 2010, the proposed DFCs for the Northern Gulf Coast Aquifer System in GMA 14 are physically possible, and thus are feasible.

A common definition of feasibility is "capable of being accomplished or brought about; possible." Using this definition, it becomes important to consider the estimates of modeled available groundwater resulting from proposed DFCs with respect to both historic use, current and projected supplies, projected water demands, and available regulatory framework necessary to achieve proposed DFCs. All of these elements were considered by GMA 14 District Representatives to confirm this finding of feasibility.

5.9 OTHER SPECIFIC INFORMATION

Finally, Texas Water Code Section 36.108 (d)(8) requires District Representatives in a GMA to consider any other information relevant to the specific desired future condition. As GMA 14 District Representatives worked through the considerations process required in Texas Water Code Section 36.108(d)(1)-(8), no additional information was identified for inclusion in this explanatory report.

5.10 BALANCE BETWEEN THE HIGHEST PRACTICABLE LEVEL OF GROUNDWATER PRODUCTION AND THE CONSERVATION, PRESERVATION, PROTECTION, RECHARGING, AND PREVENTION OF WASTE OF GROUNDWATER

GMA 14 DFCs achieve balance between the highest practicable level of groundwater production and the conservation, preservation, protection, recharging, and prevention of waste of groundwater and control of subsidence in the management area.

Texas Water Code Section 36.108(d-2) states, in part, that GCDs, while establishing DFCs during the joint-planning process in a GMA, "...must provide a balance between the highest practicable level of groundwater production and the conservation, preservation, protection, recharging, and prevention of waste of groundwater and control of subsidence in the management area." This requirement does not prohibit the establishment of desired future

⁸⁰ Texas Water Code Section 36.108(d-2)

conditions that provide for the reasonable long-term management of groundwater resources consistent with the management goals under Section 36.1071(a).⁸¹

This requirement for a balance is a new requirement in the joint-planning process resulting from the passage of Senate Bill 660 by the Texas Legislature in 2011.⁸² This requirement recognizes that the proposed DFCs may vary significantly from one area of the state to another. Texas Water Code Section 36.108(d-1) authorizes GCDs within a specific GMA to establish different DFCs for each aquifer, subdivision thereof, or geologic strata, as well as different DFCs for different geographic areas overlying those aquifers or subdivisions thereof. Such DFCs are only to be established after consideration by the GMA of the nine statutory criteria set forth in Texas Water Code Section 36.108(d), which includes consideration of "aquifer uses or conditions within the management area, including conditions that differ substantially from one geographic area to another." The proposed DFCs for GMA 14, both on the regional scale and by county, clearly document unique conditions in GMA 14 that exist in no other area of Texas that work collectively to influence the balance achieved by the proposed DFCs.

The primary groundwater resource in GMA 14 is the Gulf Coast Aquifer System. As a result, the primary emphasis during this, the second cycle of joint planning (2010 – 2016), has been on the Gulf Coast Aquifer System. All other minor or local aquifers in GMA 14 have been classified as non-relevant (see Section 7.0) for the current round of joint planning, as allowed by Title 31, Texas Administrative Code Section 356.31 (b). Overarching and disparate conditions in the Gulf Coast Aquifer System existing in GMA 14 are best illustrated by demographic dynamics, water demand projections documented in the 2012 State Water Plan⁸³, and the presence of and associated socioeconomic costs resulting from land subsidence. Current and future population projections for GMA 14 indicate that slightly more than 25 percent of Texas' population resides in GMA 14. Population projections for GMA 14 are projected to increase from 2010's 6,529,891 residents to 11,958,683 in 2060. That would equate to an 83 percent increase in population over the 50-year planning horizon. However, these significant increases in population are not uniformly distributed throughout GMA 14. For example, according to the 2012 Texas State Water Plan, increases in county population projections are expected to range from 9 percent, 11 percent, and 13 percent in Orange, Jasper, and Galveston counties, respectively, whereas in Montgomery, Fort Bend, and Waller counties, projected increases in population range from 219 percent, 199 percent, and 159 percent, respectively.

⁸¹ Texas Water Code Section 36.1071(a)

⁸² Act of May 29, 2011, 82nd Leg., R.S., ch. 1233, 2011 Tex. Gen. Laws 3287.

⁸³ Texas Water Development Board, 2012, Water For Texas – The Texas State Water Plan, 299 p. see http://www.twdb.texas.gov/waterplanning/swp/2012/index.asp.

This variability in demographic dynamics in GMA 14 translates strongly to the projections for GMA 14 water demands. As part of the regional water-planning process in Texas (Texas Water Code Section 16.053), water demand projections are developed for municipalities and utilities, manufacturing, mining, steam-electric power generation, irrigated agriculture, livestock, and rural areas within each county. For the regional and state water-planning process in Texas, water demand projections are based on an analysis of the volume of water necessary to meet projected needs during drought conditions (often referred to as drought-of-record conditions). Based on an analysis of all of these primary water use sectors in GMA 14, water demand projections range from 2,917,795 acre-feet per year in 2010 to 4,723,228 acre-feet per year in 2060, representing a 61.9 percent increase in water demands. An acre foot of water is equal to 325,851 gallons. It is noteworthy that the increase in water demands, on a percentile basis, is approximately 21.2 percent less than the increase in population, primarily a result of increased water conservation efforts throughout the region and the disconnect between population and certain demands such as irrigated agriculture.

An important element of the balance required in the joint-planning process is the consideration of how proposed DFCs may affect water supply needs and water management strategies in the current 2012 Texas State Water Plan. After consideration of water supply needs and water management strategies recommended in the 2012 Texas Water Plan and the 2011 Regions G, H, and I regional water plans⁸⁴,⁸⁵,⁸⁶, District Representatives in GMA 14 have determined that adoption and implementation of the proposed DFCs for GMA 14 will not negatively impact the implementation of any recommended water management strategies included in the 2012 Texas Water Plan. Furthermore, it is anticipated that these proposed DFCs will not negatively impact recommended water management strategies included in the Initially Prepared Plans for the 2016 round of regional water planning in the 2016 Region G, H, and I regional water plans.

Texas Water Code Section 36.108(d)(3) requires District Representatives in a GMA to consider hydrological conditions, including, for each aquifer in the GMA, the total estimated recoverable storage (TERS) as provided by the executive administrator of the Texas Water Development Board.

⁸⁶ East Texas Regional Water Planning Group, 2011, East Texas Regional Water Plan, see http://www.twdb.texas.gov/waterplanning/rwp/plans/2011/index.asp#region-i

The TERS estimates for GMA 14 were made available to GMA 14 in June of 2014⁸⁷ and, since that time, have been the subject of numerous formal discussions, both by District Representatives in GMA 14 as part of the joint-planning process, by individual GCDs in GMA 14, and during the 90-day public comment period on the proposed DFCs. These considerations of the TERS report have included a special workshop by Lone Star GCD to better understand the implications of the TERS report on future groundwater management. Specific considerations of the TERS report by GMA 14 occurred on June 24, 2014, June 24, 2015, and October 28, 2015. The TERS report for GMA 14 provides an estimate for the Gulf Coast Aquifer System that ranges from 694,000,000 to 2,082,000,000 acre-feet of water. Estimates of TERS for the other relevant aquifers in GMA 14 are also provided in this report.

While some observers of the joint-planning process have suggested that volumes of groundwater quantified in the TERS report should equate to the "highest practicable level of groundwater production" referenced in Texas Water Code Section 36.108 (d-2), District Representatives have determined that the TERS volumes for GMA 14, due to the potential impacts of excessive production on land-surface subsidence, the lowering of artesian water levels, and the resulting decreasing yields in water wells that would result from the production of even a very small fraction of the TERS volume reported by the TWDB is not even remotely practicable. Further, it was determined that adequate applied scientific research regarding the impacts for producing groundwater from storage in an artesian aquifer such as the Gulf Coast Aquifer System does not exist, and thus a conservative approach with respect to consideration of the TERS volumes is warranted.

GMA 14 is unique in that Texas Water Code Section 36.108(d)(5), requiring District Representatives to consider the impacts of proposed DFCs on subsidence, at least currently, only applies to GMA 14. In GMA 14, District Representatives clearly recognize that the socioeconomic impacts and public health and safety issues resulting from subsidence require that appropriate groundwater management policies take precedent over any other consideration. As previously described in section 5-5 on Subsidence, inaction would likely beget substantial financial consequences. Information considered by GMA 14 District Representatives included analysis that groundwater use resulting in groundwater-level declines in the Gulf Coast Aquifer System results in land surface subsidence and increased movement along growth faults in the Texas Gulf Coast.

Texas Water Code Section 36.108(d)(6) requires District Representatives in a GMA to consider the socioeconomic impacts reasonably expected to occur from the adoption of proposed DFCs. This consideration is a central element that any GMA must carefully evaluate in achieving a

_

⁸⁷ Wade, S., Thorkildsen, D., and Anaya, R., 2014, GAM Task 13-037: Total estimated recoverable storage for aquifers in Groundwater Management Area 14, 35 p.

balance between the highest practicable level of groundwater production and the conservation, preservation, protection, recharging, and prevention of waste of groundwater and control of subsidence in the management area. It is noteworthy that, in a similar planning process in Texas, the regional water-planning process, it is required that the socioeconomic impacts of not meeting water supply needs identified in the regional water-planning process is required according to guidelines adopted by the TWDB. All quantitative analysis performed to support this socioeconomic impact analysis in the regional water-planning process is performed by staff at the TWDB. This analysis is based on a straightforward valuation of water to the various water use sectors and subsectors present in any particular region. As part of the joint-planning process, all quantitative analysis performed regarding the socioeconomic impacts of not meeting future water supply needs identified in the 2011 regional water plans for Regions G, H, and I were considered by GMA 14 to, in part, meet this requirement to consider the socioeconomic impacts reasonably expected to occur from the implementation of the proposed DFCs. GMA 14 District Representatives, based both on this review and on the determination stated above that implementation of recommended water management strategies to meet water supply needs included in the 2011 regional water plans and the 2012 State Water Plan, and also in the draft 2016 regional water plans, will not be negatively impacted, have also determined that, on balance, since the proposed DFCs will not prevent implementation of recommended water management strategies, there will be no negative socioeconomic impacts utilizing the quantitative socioeconomic impact methodology utilized in the Texas regional water-planning process.

After significant consideration by GMA 14 District Representatives, however, there were a number of socioeconomic impacts identified that could be reasonably expected to occur from a qualitative perspective. As the reader will note, most, but not all, of the socioeconomic impacts identified fall on the positive side of the balancing consideration. An overview of these socioeconomic impacts includes:

- Proposed DFCs may require water users to convert to an alternative water supply, which may have increased costs associated with infrastructure, operation, and maintenance;
- Proposed DFCs may reduce/eliminate the costs of lowering pumps and either drilling or deepening of water wells;
- Proposed DFCs may reduce/eliminate the costs associated with subsidence (including legal costs assigned to parties determined to be liable);
- Proposed DFCs may serve to sustain/enhance economic growth due to assurances provided by a diversified water portfolio to new industry and development;

- Alternatives to the DFCs proposed by GMA 14 may result in short-term reduction in utility rates due to reduction in cost of water management strategy implementation; and
- Alternatives to the DFCs proposed by GMA 14 may result in significant but unquantified production costs due to transition from confined to unconfined conditions in local aquifers.

Texas Water Code Section 36.108(d)(7) requires District Representatives in a GMA to consider the impact of proposed DFCs on the interests and rights in private property, including ownership and the rights of management area landowners and their lessees and assigns in groundwater, as recognized under Texas Water Code Section 36.002. GMA 14 District Representatives formally considered this factor during meetings on September 23, 2014, June 24, 2015, and October 28, 2015. However, the impacts of proposed DFCs on private property rights has truly been an overarching consideration throughout the joint-planning process. Each District Representative provided input to GMA 14 on, not only the impacts of proposed DFCs, but also how individual District management plans and rules have been developed to achieve current DFCs (adopted in August 2010) while protecting private property rights. While the approach to protecting private property rights varies somewhat from District to District in GMA 14, depending upon local conditions, it is recognized that in addition to the proposed DFCs, all Districts in GMA 14 have developed management plans and rules that fundamentally work to protect private property rights.

After having considered each of the nine statutory criteria set forth in Texas Water Code Section 36.108(d) for the DFCs for the proposed DFCs for GMA 14, the GMA 14 District Representatives have concluded that the DFCs provide a reasonable balance between the highest practicable level of groundwater production and the conservation, preservation, protection, recharging, and prevention of waste of groundwater and control of subsidence. Each of the eight required statutory criteria contributed in some way to this conclusion, including, without limitation, the following: (1) land subsidence is a serious problem in some geographic areas of GMA 14 and can have enormous economic consequences; (2) vast differences in aquifer uses and conditions in different parts of the GMA, including huge discrepancies in demands that will be placed on groundwater resources because of expected population growth patterns over the 50-year joint-planning horizon and corresponding increases in water demand projections; (3) the impacts, or lack thereof, on recommended water management strategies in the state and regional water plans; (4) other socioeconomic impacts unrelated to land subsidence or impacts on recommended water management strategies, such as the economic costs to current and future well owners to continue to chase falling artesian water levels in the aquifer and corresponding declining well yields, including numerous existing wells completed at shallower depths that may go dry, as well as the socioeconomic risk to GMA 14's regional and local economies associated with reliance upon a single source of water supply versus the security of a diversified water supply portfolio; (5) hydrological conditions, such as total estimated recoverable storage, effective annual recharge, inflows, and discharge of the aquifer, and the relationship of those values to the current and projected groundwater pumping estimates over the joint-planning horizon, to existing well yields and groundwater-related investments, and to the long-term viability of the aquifer to serve the landowners and communities as an economically viable source of water supply; (6) the achievability of the DFCs; and (7) the impacts on the interests and rights in private property, including the ownership rights of GMA 14 landowners, which include the protection of investments by those landowners in existing wells and related infrastructure, as well as the ability of landowners to drill and produce groundwater at an economically feasible cost from new wells in the future.

THIS PAGE INTENTIONALLY LEFT BLANK

6.0 AQUIFERS DECLARED NON-RELEVANT FOR JOINT PLANNING

TWDB rules⁸⁸ allow for portions of major or minor aquifers to be classified as non-relevant if their aquifer characteristics, groundwater demands, and current groundwater uses do not warrant adoption of a desired future condition. In these cases, a desired future condition is not required. Instead, GCDs must submit documentation describing why the aquifer was considered non-relevant. This documentation includes:

- 1) A description, location, and/or map of the aquifer or portion of the aquifer;
- 2) A summary of aquifer characteristics, groundwater demands, and current groundwater uses, including the total estimated recoverable storage as provided by the executive administrator, that support the conclusion that desired future conditions in adjacent or hydraulically connected relevant aquifer(s) will not be affected; and
- 3) An explanation of why the aquifer or portion of the aquifer is non-relevant for jointplanning purposes.

This section is included in the Explanatory Report to serve as the documentation required to classify several aquifers in GMA 14 as non-relevant for joint planning and for development of a DFC. These aquifers include the Carrizo-Wilcox, Queen City, Sparta, Yegua-Jackson and several river alluviums (Brazos, San Bernard, Navasota, Trinity and San Jacinto river alluviums).

6.1 CARRIZO-WILCOX AQUIFER

Figure 6-1 shows the locations of major aquifers in GMA 14. As shown in Figure 6-1, the Gulf Coast Aquifer System is present throughout most of the management area. The Carrizo-Wilcox Aquifer is only present in subcrop in the far northern and western portions of Grimes and Walker counties. Outside of these areas, the Carrizo-Wilcox Aquifer is not recognized as an aquifer by the TWDB. It is wholly located within the Bluebonnet GCD.

All reported information on groundwater pumpage/use and current groundwater demands is included in *Table 5-2* and *Table 5-3*. Using data from the TWDB Water Use Survey program, groundwater use in Grimes and Walker counties averages 3,700 and 5,300 acre-feet per year, respectively. No groundwater production is reported from Grimes County for the Carrizo-

⁸⁸ Title 31, Texas Administrative Code Section 356.31 (b) see http://texreg.sos.state.tx.us/public/readtac\$ext.TacPage?sl=R&app=9&p_dir=&p_rloc=&p_tloc=&p_ploc=&pg= 1&p_tac=&ti=31&pt=10&ch=356&rl=31

Wilcox Aquifer and a maximum of 2 acre-feet per year has been reported in Walker County for the 10 years of data examined. Uses categorized as coming from "other" or "unknown" aquifers account for 165 and 1,600 acre-feet per year from Grimes and Walker counties, respectively.

Appendix K shows the TERS for the Carrizo-Wilcox Aquifer as defined and estimated by the TWDB.

Table 6-1 shows the water-budget values for the Carrizo-Wilcox Aquifer in Bluebonnet GCD from the District's 2013 management plan. As shown in *Table 6-1*, the aquifer receives no direct recharge from precipitation in the GCD. The primary inflow is lateral flow of approximately 2,700 acre-feet per year from the up-dip portions of the aquifer outside GMA 14. The vast majority of this discharges to deeper portions of the Carrizo and Wilcox formations. The Carrizo-Wilcox GAM indicates that, on average, only 17 acre-feet of water discharges vertically upward into the overlying Reklaw confining unit. GMA 14, therefore, expects very little impact on the Gulf Coast Aquifer System DFCs as a result of classifying the Carrizo-Wilcox Aquifer non-relevant.

Due to its limited spatial extent, current uses and connection to other aquifers, GMA 14 finds that a DFC for the Carrizo-Wilcox Aquifer in GMA 14 is not warranted and declare it non-relevant for joint-planning purposes.

Table 6-1 – Inflows and outflows to/from the Carrizo-Wilcox Aquifer in the Bluebonnet GCD management plan (GAM Run 13-028: Kohlrenken, 2013)

Management Plan Requirement	Aquifer or Confining Unit	Results
Estimated annual amount of recharge from precipitation to the district	Carrizo-Wilcox Aquifer	0
Estimated annual volume of water that discharges from the aquifer to springs and any surface water body including lakes, streams, and rivers	Carrizo-Wilcox Aquifer	0
Estimated annual volume of flow into the district within each aquifer in the district	Carrizo-Wilcox Aquifer	2,699
Estimated annual volume of flow out of the district within each aquifer in the district	Carrizo-Wilcox Aquifer	379
Estimated net annual volume of flow	From the Carrizo-Wilcox Aquifer into the Reklaw Confining Unit	17
between each aquifer in the district	From the Carrizo-Wilcox Aquifer to the downdip portions of the Carrizo and Wilcox formations	2,322

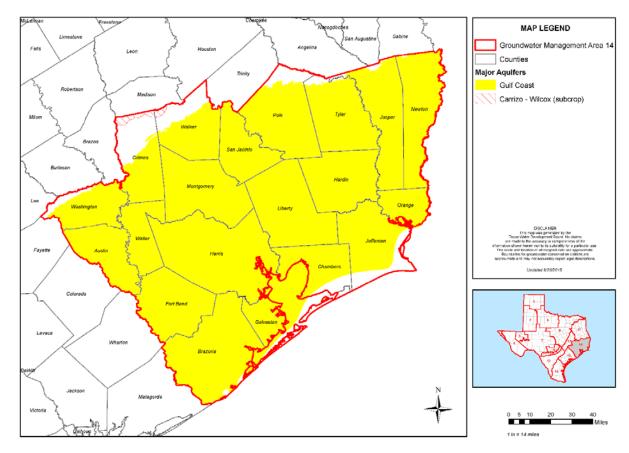

Figure 6-1 – Major Aquifers in GMA 14

6.2 QUEEN CITY AQUIFER

Figure 6-2 shows the locations of minor aquifers in GMA 14. The Queen City Aquifer is only present in subcrop in the far northern and western portions of Grimes, Walker and Washington counties. Outside of these areas, the Queen City is not recognized as an aquifer by the TWDB in GMA 14. Bluebonnet GCD encompasses Grimes and Walker counties while Washington County is not in a GCD.

All reported information on groundwater pumpage/use and current groundwater demands is included in *Table 5-2* and *Table 5-3*. Using data from the TWDB Water Use Survey program, groundwater use in Grimes, Walker, and Washington counties averages, respectively, 3,700 acre-feet per year, 5,300 acre-feet per year, and 2,200 acre-feet per year. Less than 30 acre-feet per year of this is specifically estimated to be from the Queen City Aquifer. Uses categorized as coming from "other" or "unknown" aquifers account for 165 acre-feet per year, 1,600 acre-feet per year, and 7 acre-feet per year from Grimes, Walker and Washington counties, respectively.

Appendix K shows the TERS for the Queen City Aquifer as defined and estimated by the TWDB.

Table 6-2 shows the water-budget values for the Queen City Aquifer in Bluebonnet GCD from the District's 2013 management plan. As shown in *Table 6-2*, the aquifer receives no direct recharge from precipitation in the Bluebonnet GCD. Flows in the aquifer consist of small lateral inflows from the up-dip portions of the aquifer outside GMA 14 and small vertical inflows from the underlying Reklaw confining unit. The GAM indicates that, on average, only 55 acre-feet of water discharges vertically upward into the overlying Weches confining unit. GMA 14, therefore, expects very little impact on the Gulf Coast Aquifer System DFCs as a result of declaring the Queen City Aquifer non-relevant.

Due to its limited spatial extent, current uses and connection to other aquifers, GMA 14 finds that a DFC for the Queen City Aquifer in GMA 14 is not warranted and classifies it non-relevant for joint-planning purposes.

Table 6-2 – Inflows and outflows to/from the Queen City Aquifer in the Bluebonnet GCD management plan (GAM Run 13-028: Kohlrenken, 2013)

Management Plan Requirement	Aquifer or Confining Unit	Results
Estimated annual amount of recharge from precipitation to the district	Queen City Aquifer	0
Estimated annual volume of water that discharges from the aquifer to springs and any surface water body including lakes, streams, and rivers	Queen City Aquifer	0
Estimated annual volume of flow into the district within each aquifer in the district	Queen City Aquifer	134
Estimated annual volume of flow out of the district within each aquifer in the district	Queen City Aquifer	98
	From the Queen City Aquifer into the Weches Confining Unit	190
Estimated net annual volume of flow between each aquifer in the district	From the Reklaw Confining Unit into the Queen City Aquifer	55
	From the downdip portion of the Queen City formation to the Queen City Aquifer	49

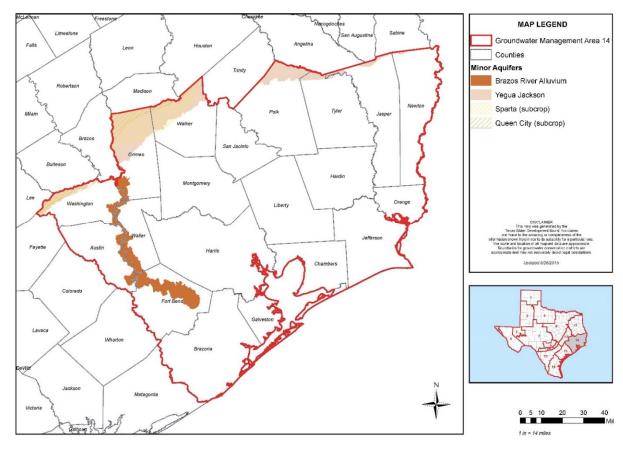

Figure 6-2 – Minor aquifers in GMA 14

6.3 SPARTA AQUIFER

Figure 6-2 shows the locations of minor aquifers in GMA 14. The Sparta Aquifer is only present in subcrop in the northern and western portions of Grimes, Walker, and Washington counties. Outside of these areas, the Sparta Aquifer is not recognized as an aquifer by the TWDB. Bluebonnet GCD encompasses Grimes and Walker counties while Washington County is not in a GCD.

All reported information on groundwater pumpage/use and current groundwater demands is included in *Table 5-2* and *Table 5-3*. Using data from the TWDB Water Use Survey program, groundwater use in Grimes, Walker, and Washington counties averages, respectively, 3,700 acre-feet per year, 5,300 acre-feet per year, and 2,200 acre-feet per year. Less than 5 acre-feet per year of this is specifically estimated to be from the Sparta Aquifer. Uses categorized as coming from "other" or "unknown" aquifers account for 165 acre-feet per year, 1,600 acre-feet per year, and 7 acre-feet per year from Grimes, Walker, and Washington counties, respectively.

Appendix K shows the TERS for the Sparta Aquifer as defined and estimated by the TWDB.

Table 6-3 shows the water-budget values for the Sparta Aquifer in Bluebonnet GCD from the District's 2013 management plan. As shown in *Table 6-3*, the aquifer receives no direct recharge from precipitation in the district. Flows in the aquifer consist of small lateral inflows from the up-dip portions of the aquifer outside GMA 14 and small vertical inflows from the Weches confining unit. The GAM indicates that, on average, only 31 acre-feet of water discharges vertically upward into the overlying units. GMA 14, therefore, expects very little impact on the Gulf Coast Aquifer DFCs as a result of classifying the Sparta Aquifer non-relevant.

Due to its limited spatial extent, current uses and connection to other aquifers, GMA 14 finds that a DFC for the Sparta Aquifer in GMA 14 is not warranted and classifies it non-relevant for joint-planning purposes.

Table 6-3 – Inflows and outflows to/from the Sparta Aquifer in the Bluebonnet GCD management plan (GAM Run 13-028: Kohlrenken, 2013)

Management Plan Requirement	Aquifer or Confining Unit	Results
Estimated annual amount of recharge from precipitation to the district	Sparta Aquifer	0
Estimated annual volume of water that discharges from the aquifer to springs and any surface water body including lakes, streams, and rivers	Sparta Aquifer	0
Estimated annual volume of flow into the district within each aquifer in the district	Sparta Aquifer	338
Estimated annual volume of flow out of the district within each aquifer in the district	Sparta Aquifer	482
	From the Sparta Aquifer to overlying units	31
Estimated net annual volume of flow between each aquifer in the district	From the Weches Confining Unit into the Sparta Aquifer	208
	From the Sparta Aquifer to the downdip portion of the Sparta Formation	49

6.4 YEGUA-JACKSON AQUIFER

Figure 6-2 shows the locations of minor aquifers in GMA 14. The Yegua-Jackson Aquifer is only present in the far northern and western portions of GMA 14 (Grimes, Walker, Washington, Polk, Tyler, Jasper, and Newton counties). Outside of these areas, the Yegua-Jackson is not recognized as an aquifer by the Texas Water Development Board in GMA 14. The Yegua-Jackson Aquifer is present in Bluebonnet GCD, Lower Trinity GCD, and Southeast Texas GCD.

All reported information on groundwater pumpage/use and current groundwater demands is included in *Table 5-2* and *Table 5-3*. Using data from the TWDB Water Use Survey program, the average groundwater pumping from the Yegua-Jackson Aquifer between 2000 and 2011

was approximately 1,900 acre-feet per year with a maximum annual use of 3,700 acre-feet per year. On average the Yegua-Jackson Aquifer accounts for approximately 3 percent of the groundwater use in the counties where it exists (*Figure 6-2*), with the maximum of 16 percent in Grimes County.

Appendix K shows the TERS for the Yegua-Jackson Aquifer as defined and estimated by the TWDB.

Table 6-4,

Table 6-5, and Table 6-6 show the water-budget values for the Yegua-Jackson Aquifer in Bluebonnet, Lower Trinity, and Southeast Texas GCDs, respectively. In Bluebonnet GCD the Yegua-Jackson receives considerable recharge. However, more than 80 percent of this quickly discharges to lakes, streams, and rivers. Most of the water that does not discharge to surface water flows laterally out of the districts. The GAM indicates that, on average, 691 acre-feet of water flows vertically into the Yegua-Jackson Aquifer from the overlying Catahoula Formation (limited to Bluebonnet GCD). GMA 14 expects very little impact on the Gulf Coast Aquifer DFCs as a result of declaring the Yegua-Jackson Aquifer non-relevant.

Due to its limited spatial extent, current uses and connection to other aquifers, GMA 14 finds that a DFC for the Yegua-Jackson Aquifer in GMA 14 is not warranted and classify it non-relevant for joint-planning purposes.

Table 6-4 – Inflows and outflows to/from the Yegua-Jackson Aquifer in the Bluebonnet GCD management plan (GAM Run 13-028: Kohlrenken, 2013)

Management Plan Requirement	Aquifer or Confining Unit	Results
Estimated annual amount of recharge from precipitation to the district	Yegua-Jackson Aquifer	47.258
Estimated annual volume of water that discharges from the aquifer to springs and any surface water body including lakes, streams, and rivers	Yegua-Jackson Aquifer	38,660
Estimated annual volume of flow into the district within each aquifer in the district	Yegua-Jackson Aquifer	6,829
Estimated annual volume of flow out of the district within each aquifer in the district	Yegua-Jackson Aquifer	14,759
Estimated net annual volume of flow	From the confined portion of the Yegua-Jackson units into the official Yegua-Jackson Aquifer	691
between each aquifer in the district	From the Catahoula and overlying units into the Yegua-Jackson Aquifer	598

Table 6-5 – Inflows and outflows to/from the Yegua-Jackson Aquifer developed for the Lower Trinity GCD management plan (GAM Run 14-006: Kohlrenken, 2014)

Management Plan Requirement	Aquifer or Confining Unit	Results
Estimated annual amount of recharge from precipitation to the district	Yegua-Jackson Aquifer	4,114
Estimated annual volume of water that discharges from the aquifer to springs and any surface water body including lakes, streams, and rivers	Yegua-Jackson Aquifer	3,879
Estimated annual volume of flow into the district within each aquifer in the district	Yegua-Jackson Aquifer	1,950
Estimated annual volume of flow out of the district within each aquifer in the district	Yegua-Jackson Aquifer	2,826
Estimated net annual volume of flow between each aquifer in the district	To the Yegua-Jackson Aquifer from the confined portion of the Yegua and Jackson groups	434

Table 6-6 – Inflows and outflows to/from the Yegua-Jackson Aquifer developed for the Southeast Texas GCD management plan (GAM Run 11-019: Jones, 2012)

Management Plan Requirement	Aquifer or Confining Unit	Results
Estimated annual amount of recharge from precipitation to the district	Yegua-Jackson Aquifer	5
Estimated annual volume of water that discharges from the aquifer to springs and any surface water body including lakes, streams, and rivers	Yegua-Jackson Aquifer	152
Estimated annual volume of flow into the district within each aquifer in the district	Yegua-Jackson Aquifer	751
Estimated annual volume of flow out of the district within each aquifer in the district	Yegua-Jackson Aquifer	798
Estimated net annual volume of flow between each aquifer in the district	From Yegua-Jackson Aquifer into overlying units	33

6.5 RIVER ALLUVIUM AQUIFERS

Figure 6-2 shows the location of minor aquifers in GMA 14. The Brazos River Alluvium Aquifer is present in portions of Grimes, Washington, Waller, Austin, and Fort Bend counties. Though not recognized as minor aquifers by the TWDB, several other alluvial aquifers are also present in GMA 14. These include the Navasota River Alluvium Aquifer (Figure 6-3), the San Bernard River Alluvium Aquifer (Figure 6-4), the San Jacinto River Alluvium Aquifer (Figure 6-5), and the Trinity River Alluvium Aquifer (Figure 6-6). All of the river alluvium aquifers are present in

Bluebonnet GCD. Washington County does not have a GCD. In Fort Bend County, groundwater is regulated by the Fort Bend Subsidence District.

All reported information on groundwater pumpage/use and current groundwater demands is included in *Table 5-2* and *Table 5-3*. Using data from the TWDB Water Use Survey program, groundwater production from the Brazos River Alluvium Aquifer between 2000 and 2011 averaged approximately 1,300 acre-feet per year with a maximum of 1,700 acre-feet per year. While estimates are not available for the other river alluvium aquifers, Bluebonnet GCD has indicated that the small amount of pumping that does occur from these aquifers is exempt from GCD permitting.

Appendix K shows the TERS for each of the river alluvium aquifers as defined and estimated by the TWDB.

At this time, a GAM is being developed for the Brazos River Alluvium Aquifer, but is not yet completed. TWDB does not have GAMs completed or in development for the remaining river alluvium aquifers. For this reason, water-budget inflows and outflows are not available for the river alluvium aquifers. GMA 14, however, expects very little impact on the Gulf Coast Aquifer DFCs as a result of classifying the river alluvium aquifers non-relevant. This is because 1) the alluvial aquifers are very shallow relative to pumping horizons of the Gulf Coast Aquifer, and 2) the magnitude of pumping in the alluvial aquifers is very small compared to that of the Gulf Coast Aquifer.

Due to their limited spatial extent, current uses and connection to other aquifers, GMA 14 finds that DFCs for the river alluvium aquifers in GMA 14 are not warranted and classifies them non-relevant for joint-planning purposes.

7.0 OTHER DFC OPTIONS CONSIDERED

During this round of joint planning in GMA 14, the new requirement for GMAs to address other DFC options that were considered but not adopted (Texas Water Code Section 36.108 (d - 3)(4)) led the District Representatives to develop and adopt, by resolution, administrative procedures that clearly prescribed the process for recognizing any suggested proposals for DFCs as official "options" that would then need to be addressed in the explanatory report. The administrative produces (see Appendix T) clearly articulate the procedures for any suggested proposals for DFCs to be designated as official options. Once designated as an official DFC option, then the District Representatives considered the nine factors included in Texas Water Code Section 36.108 (d) (1-9) with respect to the DFC option.

Following the process prescribed in the adopted administrative procedures, GMA 14 District Representatives only designated one DFC option for the four aquifers in the Gulf Coast Aquifer System. After consideration of the nine factors on the approved DFC option, this option was ultimately adopted as the Final DFC for the four aquifers in the Gulf Coast Aquifer System (see Appendix E). There were no other DFC options considered during this round of joint planning by GMA 14 District Representatives.

THIS PAGE INTENTIONALLY LEFT BLANK

8.0 RECOMMENDATIONS BY ADVISORY COMMITTEES AND RELEVANT PUBLIC COMMENTS

In accordance with Texas Water Code Section 36.108(d-3) and (d-4), this section of the Explanatory Report discusses reasons why recommendations made by advisory committees and relevant public comments received by the GCDs during the joint-planning process were or were not incorporated into the DFCs ultimately adopted on April 29, 2016.

The consideration, proposal, and adoption of DFCs in the joint-planning process, as described in Section 2.0 of this Explanatory Report, is necessarily a public, transparent process authorized only through open, publicly noticed meetings as required by the provisions of Chapter 36, Texas Water Code, and the Open Meetings Act, Texas Government Code. Over the course of several years, beginning in 2010, GMA 14 has held multiple joint-planning meetings to consider information in order to develop DFCs, including research applicable to the nine statutory factors and other relevant scientific and hydrogeological data. The Fort Bend Subsidence District and Harris-Galveston Subsidence District, special districts statutorily obligated to regulate groundwater withdrawals within their respective jurisdictions in GMA 14 for the purpose of preventing land subsidence, and other public stakeholders from Chambers and Washington counties sought participation early on in the joint-planning process to develop DFCs. As a result, these stakeholders were appointed to a nonvoting advisory committee to assist in the development of the DFCs pursuant to Texas Water Code Section 36.1081. With the exception of this advisory committee, GMA 14 received little to no public participation or comments throughout the majority of the joint-planning process. Only in the final months of the DFC process did GMA 14 receive comments from the public.

On October 28, 2015, the District Representatives in GMA 14 approved proposed DFCs for the purpose of drafting this Explanatory Report. The proposed DFCs provided acceptable drawdown levels for each subdivision of the Gulf Coast Aquifer System, including the Chicot, Evangeline, Burkeville, and Jasper (formations/aquifers), for each county located within GMA 14, as well as acceptable land subsidence levels, as applicable. The acceptable levels of drawdown for each subdivision of the Gulf Coast Aquifer System were measured in terms of water level drawdowns over the current planning cycle measured in feet from 2009 estimated water levels. These proposed DFCs were also supported by the advisory committee stakeholders.

The GCDs in GMA 14 each prepared a Summary Report inclusive of all relevant comments received during the 90-day public comment period regarding the proposed DFCs, any suggested revisions to the proposed DFCS, and the basis for the revisions. The GCDs'

Summary Reports were submitted to GMA 14 for further review by the District Representatives at a joint-planning meeting held October 28, 2015. In evaluating the comments received, GMA 14 District Representatives deemed certain comments relevant to the proposed DCFs. The remainder of this section identifies the relevant comments received and discusses why these comments were or were not incorporated into the DFCs.

As set forth in the public comments received, one commenter contended that the adoption of different DFCs for different geographic areas over the same aquifer—along the boundaries of political subdivisions—was not authorized by law, and as such the proposed DFCs were legally and hydrogeologically wrong. The commenter further stated that such proposed DFCs would cause GCDs to adopt different regulatory schemes, including different production limits, which would allow landowners producing groundwater in GCDs with less restrictive regulations to unfairly drain groundwater from landowners in adjacent GCDs with more restrictive regulations. The commenter claimed that this sort of activity constituted a regulatory taking of property by the GCDs as a result of the proposed DFCs.

The District Representatives to GMA 14 did not recommend any substantive changes to the proposed DFCs, but did recommend changes in the presentation and explanation of those DFCs. As originally proposed, it appeared the District Representatives proposed separate DFCs for each GCD and county in GMA 14; in actuality, the proposed DFCs applied throughout GMA 14, with a separate DFC for each of the four primary formations within the Gulf Coast Aquifer System. The presentation changes made it clear that GMA 14 was adopting four DFCs, but then also provided how the Northern Gulf Coast Aquifer GAM calculated the impact on each individual county within GMA 14.

To the extent the comments are directed at different DFCs for each aquifer formation they relate to policy issues GCDs face in considering, proposing, and adopting DFCs. As previously noted, the adoption of DFCs by GCDs, pursuant to the requirements and procedures set forth in Texas Water Code Chapter 36, is an important policy-making function. DFCs are planning goals that state a desired condition of the groundwater resources in a GMA in the future in order to promote better management of those resources on a long-term basis. GCDs are authorized to utilize different approaches in developing and adopting DFCs based on local conditions and the consideration of other statutory criteria as set forth in Texas Water Code Section 36.108. Contrary to the commenter's statements, the law authorizes GCDs in a GMA to adopt different DFCs for different geographic areas over the same aquifer based on political boundaries. However, whether this approach to setting DFCs should be utilized by the GCDs in GMA 14 is a policy decision the GCDs must make after careful consideration of local conditions and all other mandatory, statutory criteria as part of the joint-planning process.

Texas Water Code Section 36.108(d)(1) contemplates and authorizes the adoption of different DFCs for different geographic areas over the same aquifer based on the boundaries

of political subdivisions. First, the statute expressly and specifically *directs* GCDs "to consider uses or conditions of an *aquifer* within the management area, including conditions that differ substantially from one geographic area to another" when developing and adopting DFCs. ⁸⁹ The use of the singular "aquifer" in this context clearly demonstrates that the Legislature intended that the uses and conditions in different geographic areas *over the same aquifer* were to be considered when adopting DFCs. Second, Texas Water Code Section 36.108(d-1) provides that districts may establish different DFCs for:

- 1) each aquifer, subdivision of an aquifer, or geologic strata located in whole or in part within the boundaries of the management area; *or*
- 2) each geographic area overlying an aquifer in whole or in part or subdivision of an aquifer within the boundaries of the management area.⁹⁰

The Legislature's addition of the phrase "in whole or in part" makes it clear that GCDs may establish a "different" DFC for a geographic area that does not overlie a whole aquifer but only part of that aquifer. Moreover, the plain meaning of the term "geographic area" in this context clearly includes an area defined by political boundaries such as those of a GCD or a county. ⁹¹ Any other reading of "geographic area" in Texas Water Code Section 36.108(d-1) would be highly strained and contrary to the obvious intent of the larger statute. ⁹²

Such statutory authorization has also been recognized by the TWDB. In 2009, after GMA 1 adopted different DFCs for different geographic areas over the same aquifer (the Ogallala Aquifer) along the boundaries of political subdivisions, Mesa Water, LP and G&J Ranch (collectively the "Petitioners") filed a petition with the TWDB to appeal the reasonableness of the adopted DFCs. ⁹³ The same complaints made in opposition of the DFCs adopted by GMA 1 are the same complaints made by the commenter to the GCDs in GMA 14 in opposition of the proposed DFCs. In their appeal of the DFCs adopted by GMA 1, Petitioners argued that, overall, the DFCs had no scientific basis and that the DFCs should be uniform on an aquifer-wide basis to ensure all areas and landowners receive "equal treatment." However, on February 17, 2010, the TWDB considered and approved its staff's recommendation that the DFCs adopted by GMA

⁸⁹ Tex. Water Code § 36.108(d)(1) (emphasis added).

⁹⁰ *Id.* § 36.108(d-1) (emphasis added).

⁹¹ See *Morales v. Liberty Mutual Insurance Co.*, 241 S.W.3d 514, 517-18 (Tex. 2007) (stating that a particular term is to be considered and interpreted in the context of the entire statutory provision).

⁹² See *McIntyre v. Ramirez*, 109 S.W.3d 741, 745 (Tex. 2003) (stating that it is improper to give an undefined statutory term a meaning that is out of harmony or inconsistent with other provisions in the statute).

⁹³ See TEX. WATER CODE ANN. § 36.108(I) (West 2009).

1 were reasonable.⁹⁴ The TWDB staff's analysis concluded that political boundaries, such as county lines, can be used to define geographic areas for different DFCs provided that aquifer uses and conditions support the designation of the areas. In reaching this conclusion, TWDB staff addressed private property rights, stating that "[t]o one degree or another, all DFCs adopted by groundwater conservation districts potentially impact the exercise of private property rights." The TWDB staff explained that "beyond outright prohibition, the impact on private property rights involves the balancing of competing interest." ⁹⁶

During the joint-planning process for GMA 14, District Representatives considered uses and conditions of the Gulf Coast Aquifer System, as required by Texas Water Code Section 36.108(d)(1). District Representatives studied uses and conditions for each subdivision of the Gulf Coast Aquifer System, including the Chicot, Evangeline, Burkeville, and Jasper, for each county located within GMA 14. Evidence was provided and considered that demonstrated different types of uses of groundwater, differences in historic pumping, and different environmental conditions that were distinguishable in the various geographic areas of GMA 14 and described conveniently by reference to the counties (a more detailed discussion of these considerations is included below in the discussion of aquifer uses and conditions in *Section 5.1*).

For these reasons, in developing proposed DFCs, District Representatives in GMA 14 found it reasonable to divide the geographic area over each subdivision of the Gulf Coast Aquifer System for the different DFCs using the political boundaries of the counties. This finding was further supported by other relevant factors considered by District Representatives in GMA 14, including: (1) the heavy utilization by the TWDB and the regional water planning groups in the state and regional water-planning processes of information and data related to water supply and demand and other demographic information on a county-by-county basis, (2) the ability of the public to identify the boundaries of the geographic areas delineated, and (3) the ability of the GCDs—the responsible planning and regulatory entities created along county boundaries by the Texas Legislature—to achieve the DFCs, as mandated by law.

⁹⁴ See Texas Water Development Board, Report on Appeal of the Reasonableness of the Desired Future Conditions Adopted by Groundwater Management Area 1 for the Ogallala and Rita Blanca Aquifers (February 10, 2010) available at

http://www.twdb.texas.gov/groundwater/petitions/doc/GMA1/2009_Petitions/Mesa_G&J_Ranch/TWDB_Staff __Report_GMA1_Petitions_02-10.pdf.

⁹⁵ *Id.* at 4 (citing Tex. Water Code Ann. § 36.002 (West 2009) ("Ownership and rights of the owners of the land . . . in groundwater are hereby recognized, and nothing in this code shall be constituted as depriving or divesting the owners . . . of the ownership or rights, *except as those rights may be limited or altered by rules promulgated by a district.*") (Emphasis added).

⁹⁶ Id.

Also, as part of the joint-planning process, District Representatives in GMA 14 considered impacts to private property rights and interests in groundwater, as required by Texas Water Code Section 36.108(d)(7). The Gulf Coast Aquifer System is a finite resource that replenishes at a lower rate than is required to meet all current and projected water demands. Accordingly, the consideration of impacts to private property rights necessitated the careful balancing of competing interests. For instance, it is essential to protect the property rights of existing well owners and their abilities to realize their reasonable investment-backed expectations from their wells. It is also essential to protect the property rights of landowners who have yet to drill water wells on their properties. Protecting the property rights of landowners who may be impacted by subsidence is also critical. The concerns raised by commenters regarding future harm to landowners along adjacent county lines were weighed against the real and present economic harm to existing groundwater users in certain areas of GMA 14 where groundwater levels continue to decline as demands exceed available, sustainable supplies—such as is the case in Montgomery County. In balancing all sectors, District Representatives found that it was reasonable to divide the geographic area over each subdivision of the Gulf Coast Aquifer System for the different DFCs using the political boundaries of the counties in order to protect existing users in the more stressed areas of GMA 14, which were best delineated on a county-by-county basis.

As previously noted, the GCDs also received comments suggesting that the proposed DFCs will result in a taking of property. However, these assumptions are not only speculative, but also counterintuitive to the fundamental principles in support of local groundwater management and regulation by GCDs. In Texas, the legislature has declared GCDs as the preferred method of groundwater management.⁹⁷ Unlike the statewide regulation of oil and gas, local GCDs are required to manage and protect the groundwater resources within their jurisdiction pursuant to their statutory powers and duties as set forth in Texas Water Code Chapter 36 and their respective enabling legislation. While the GCDs in a GMA may adopt aquifer-wide DFCs, the adoption of such DFCs does not prevent the GCDs from adopting different regulatory plans based on local conditions and uses occurring in each GCD.

Nonetheless, after consideration of these comments, the District Representatives of GMA 14 approved non-substantive changes to the proposed DFCs. The DFCs that were considered and proposed for final adoption, inclusive of all non-substantive changes, provided acceptable drawdown levels for each hydrogeologic subdivision of the Gulf Coast Aquifer System, including the Chicot, Evangeline, Burkeville, and Jasper, on two different scales—on an aquifer-wide basis for the entire geographic extent of the aquifer subdivisions in GMA 14 and on a county-by-county geographic basis, in light of the various considerations set forth

⁹⁷ See Tex. Water Code § 36.0015 (b)

above—and acceptable land subsidence levels, as applicable, for certain counties located within GMA 14. These proposed DFCs, inclusive of acceptable drawdown levels on an aquiferwide scale and a county-by-county basis, were finally adopted by the District Representatives in GMA 14 on April 29, 2016, at a properly noticed joint-planning meeting. These non-substantive changes were also supported by the advisory committee stakeholders. As a result, the policy issues raised by commenters as discussed above are now moot.

The GCDs also received various comments regarding the failure to factor economic and hydrologic constraints into the calculation of total estimated recoverable storage ("TERS"). In June of 2014, as required by amendments to Texas Water Code Chapter 36, resulting from the passage of Senate Bill 660 in 2011, the executive administrator of the TWDB submitted the initial report on total estimated recoverable storage to GMA 14 District Representatives. While GMA 14 District Representatives were cognizant of the enormity of this new responsibility assigned to the TWDB, significant concerns were raised both by GMA 14 District Representatives and also during public comments regarding the lack of usefulness of this information for two primary reasons. First, in the TWDB analysis, it was confirmed that there were no constraints placed on the recoverability analysis due to the obvious and inevitable negative economic impacts that will result with the reduction and elimination of artesian pressures in systems like the Gulf Coast Aquifer System. Second, sufficient information was provided to prove the far-reaching negative consequences of adopting DFCs based on a percentage of storage calculated from TERS, as proposed by commenters.

Based on input from GMA 14 District Representatives and technical presentations received during the 90-day public comment period, in particular two presentations by representatives from INTERA, Inc. on behalf of various stakeholders, including those stakeholders participating in the advisory committee, the negative economic impacts resulting from the elimination of artesian pressures from the Gulf Coast Aquifer System, a dynamic projected to occur with less than one percent of the TERS volume being produced, clearly resulted in the elimination of the Gulf Coast Aquifer System as a viable water resource for almost all water use sectors. These economic impacts are, in part, driven by the negative impacts on well yields that will result with the inevitable conversion from confined to unconfined conditions as water levels are lowered due to pumping. The analysis provided in the TERS report to GMA 14 by the TWDB does not factor in either economics or hydrology into the calculations. GMA 14 District Representatives strongly encourage the TWDB to conduct necessary science to better constrain future estimates of TERS, taking into consideration the negative impacts of economics and hydrology, on the volumes of water that can reasonably be expected to be recovered from storage.

GMA 14 District Representatives carefully weighed all comments received on this issue of TERS and ultimately decided, for the reasons provided above (as also discussed in Section

5.10 of this Explanatory Report) that, due to other considerations, in particular the negative socioeconomic impacts of subsidence, TERS has no practical application in the GMA 14 joint-planning process or in groundwater management of the Gulf Coast Aquifer System. Therefore, the public comments received on this issue did not result in any changes to the DFCs.

Finally, public comments were also received from both sides of the issue of the balance between the highest practicable level of groundwater production and the conservation, preservation, protection, recharging, and prevention of waste of groundwater and control of subsidence. Some comments received suggested that there should be sustainable management of groundwater resources in GMA 14 through proactive conservation and management. These comments were predicated on the critical need for the long-term viability of the economy and environment in the region, both today and for future generations. Others have suggested that as much as 5 percent of the groundwater in storage in the Jasper Aquifer should be allocated for pumping over the next 50 years in order to sustain anticipated economic development. The balance achieved by GMA 14 with respect to the volume of groundwater quantified in the TERS report may be compartmentalized into two areas.

In the more rural areas of GMA 14, water demands will easily be met by proposed DFCs resulting from selected pumping projections. As such, the TERS estimates in these rural areas are functionally irrelevant in proposing DFCs. In the urban, fast-growing areas of GMA 14, District Representatives have balanced the TERS volumes with the need to mitigate the impacts of subsidence, the impacts of declining artesian water levels on existing and future well owners (in particular, the economic impacts on smaller utilities with limited customer base and individual landowners with limited economic means to drill for and produce groundwater), and the negative consequences of decreasing well yields that result when artesian water levels are lowered/eliminated and groundwater is produced form storage. Ultimately, for the reasons provided in Section 5.10, GMA 14 did not revise the DFCs in response to these comments.

		Date Review Complete	ed:	
	Citation of Rule	Present in packet and administratively complete	Notes	
1. Is a copy of the explanatory report addressing the information required by Texas Water Code §36.108(d-3) and the criteria in Texas Water Code §36.108(d) included? (refer to Explanatory Report checklist before responding)	31 TAC §356.32(1)	See attached		
2. Is a copy of the resolution of the groundwater management area adopting the desired future conditions as required by Texas Water Code §36.108(d-3) included?	31 TAC §356.32(2)	See Appendix E		
3. Is a copy of the notice that was posted for the joint planning meeting at which the districts collectively adopted the desired future condition(s) as required by Texas Water Code §36.108(e) and §36.108(e-2) included?	31 TAC §356.32(3)	See Appendix B		
4. Is the name of a designated representative of the groundwater management area for TWDB staff to contact as necessary included?	31 TAC §356.32(4)	Kathy Turnery Jones Lone Star GCD See Transmittal Letter		
5. Are any groundwater availability model files or aquifer assessments acceptable to the executive administrator used in developing the adopted desired future condition with documentation sufficient to replicate the work included? (refer to the Groundwater Availability Model Administrative Elements checklist before responding)	31 TAC §356.32(5)	See Appendix F		

Isoministrator may require to be able to estimate	31 TAC §356.32(6)	NA

Texas Water Development Board				
Desired Future Condition Subm	ission Packet Ch	ecklist - Factors and Technical El	ements (part 3)	
Groundwater Management Area:				
		Date Packet Received:		
Reviewing Staff:				
	Citation of Rule	Present in packet and administratively complete	Notes	
Does the explanatory report identify each desired future condition?	TWC §36.108(d- 3)	See Section 3.0 and Appendix E.		
2. Does the explanatory report provide the policy and technical justifications for each desired future condition?	TWC §36.108(d- 3)	See Section 4.0 – 4.3 (Pages 26 – 37), Section 5.10 (Pages 94 – 100),		
3. Does the explanatory report include documentation that the factors under Subsection (d) were considered by the districts and a discussion of how the adopted desired future conditions impact each factor?	TWC §36.108(d-	See Executive Summary (Pages 7 – 12) and Section 5.0 – 5.10 (Pages 38 – 100), Appendix D,		
3a. Did the districts consider aquifer uses or conditions within the management area, including conditions that differ substantially from one geographic area to another?	TMO	See Section 5.1 (Pages 38 – 68), Appendix G, Appendix H,		
3b. Did the districts consider the water supply needs and water management strategies included in the state water plan?		See Section 5.2 (Pages 68 – 73), Appendix I		
3c. Did the districts consider hydrological conditions, including for each aquifer in the management area the total estimated recoverable storage as provided by the executive administrator, and the average annual recharge, inflows, and discharge?	TMC	See Section 5.3 (Pages 73 – 80), , Appendix J, Appendix K, and Appendix L		
3d. Did the districts consider other environmental impacts, including impacts on spring flow and other interactions between groundwater and surface water?	_	See Section 5.4 (Page 80), Appendix M		

3e. Did the districts consider the impact on subsidence?	TWC §36.108(d5)	See Section 5.5 (Pages 80 – 86), Appendix N,		
3f. Did the districts consider socioeconomic impacts reasonably expected to occur?	TWC §36.108(d6)	See Section 5.6 (Pages 86 – 90), Appendix O, Appendix P, Appendix Q, Appendix R		
3g. Did the districts consider the impact on the interests and rights in private property, including ownership and the rights of management area landowners and their lessees and assigns in groundwater as recognized under Section 36.002?	TWC §36.108(d7)	See Section 5.7 (Pages 90 – 92), Appendix S		
3h. Did the districts consider the feasibility of achieving the desired future condition?	TWC §36.108(d8)	See Section 5.8 (Pages 92 – 94)		
3i. Did the districts consider any other information relevant to the specific desired future conditions?	TWC §36.108(d9)	NA		
4. Does the explanatory report list other desired future condition options considered, if any, and the reasons why those options were not adopted?	TWC §36.108(d-3)(4)	See Section 7.0 (Page 115). Aquifers declared not relevant for joint planning included in Section 6.0 (Pages 102 – 114)		
5. Does the explanatory report discuss reasons why recommendations made by advisory committees and relevant public comments received by the districts were or were not incorporated into the desired future conditions?	TWC §36.108(d-3)(5)	See Section 8.0 (Pages 115 – 122)

Groundwater Management Area:					
Groundwater Management Area Coordinator and contact	t information				
	Date Packet Received:				
Reviewing Staff:		Date Review Completed:			
	Present in packet and administratively complete	Notes	Contacted GMA Coordinator (date and by whom)	Additional data received and loaded onto network (date/TWDB staff name)	
Summary report that includes the following:					
 a. Modeling contact information if clarification is needed 	See Appendix F				
b. Date and year of submittal	Submitted with DFC package				
 Seal by Texas Professional Geoscientist or Engineer 	See Appendix F				
d. Groundwater Management Area and requested by whom	See Appendix F				
e. Description of Desired Future Condition (DFC)	See Appendices A and F				
f. Approach: Modeling Methods Document to include parameters and assumptions such as:					
 i. Groundwater availability model (GAM) version or acceptable alternative model, and version of acceptable pre-/post-processor used, if applicable 	See Appendix F				
ii. table or description of stress periods and corresponding years/months	See Appendix F				
iii. if the end of the calibration period is different from the start of the predictive simulations describe assumptions for projecting model from end of calibration to beginning conditions for predictive simulation including pumping, recharge, and related surface water heads. Include targets and hydrographs, as applicable, in appendix as well as electronic copies.	NA				
iv. Assumption for recharge i.e. what years averaged and/or drought and related stress periods, etc.	NA	Unmodified from NGC GAM.			
v. Assumption for pumping in prediction such as:					
 same distribution as end of calibration and increase or decrease per county and layer? 	See Appendix F				
New wellfields (include maps),	NA	Unmodified from NGC GAM.			
Some other method—please provide as much detail as needed.	NA				

g. Version of TWDB "model grid" file that associates model grids with counties, groundwater conservation districts, river basins, groundwater management areas, and regional water planning areas within the model study area using a centroid based approach. These files are available to download on each of the respective model web pages noted above.	See Appendix F		
h. Description of method used to extract data from model; for example, method and assumptions used to average drawdown etc. Include a description of how dry cells were treated in averaging drawdown.	See Appendix F		
 Results Section to include appropriate tables of pumping versus drawdown, volume, surface water discharge, etc by aquifer, layer, etc. as applicable to the DFC statement. 	See Appendix F		
j. References	NA NA		
 Related model files (MODFLOW), PEST or other automated calibration files (if used), target files (for establishing starting conditions) with appropriate read me files. 	See Appendix F

AGENDAS Postings

BLUEBONNET GCD

NOTICE OF OPEN MEETING

As required by Section 36.108(e), Texas Water Code, a meeting of the Groundwater Management Area 14 Joint Planning Committee, comprised of representatives from the following groundwater conservation districts located wholly or partially within Groundwater Management Area 14: Bluebonnet GCD, Brazoria County GCD, Brazos Valley GCD, Lone Star GCD, Lower Trinity GCD, and Southeast Texas GCD will be held on Wednesday, May 22, 2013, at 10:00 am at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303.

At this meeting, the following business may be considered and recommended for Joint Planning Committee possible action:

- 1. Call to order
- 2. Welcome and Introductions
- 3. Public Comment

(Public comment is limited to a maximum of 5 minutes per speaker and/or 30 minutes total for all speakers)

- 4. Receipt of Posted Notices
- 5. Discussion and possible action to approve minutes of April 24, 2013 GMA 14 Joint Planning Meeting.
- 6. Presentation of information from the Texas Water Development Board and discussion of items of interest to the GMA
- 7. Presentation and Discussion by Districts of recent activities of interest to or impacting the GMA 14 planning group.

Meeting will be convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants. 8, GMA 14 Interlocal Agreements Financial Report

- 9. Discussion and possible action to approve action plan for GMA 14 to reach statutory mandates
 - a. Discuss and take possible action to approve Interlocal Agreement Related to Joint Planning in GMA 14 including discussion of funding availability from each entity proposed to be a participant in the agreement.
 - Discuss, consider and take possible action on the procurement of professional services to support the development of desired future conditions during the current joint-planning effort in GMA 14 as required by Texas Water Code 26.108 and presentation of proposed scope of services

GMA 14 Interlocal Agreement Participants meeting will be adjourned

- 10. Legislative update SB 1282 (DFC extension bill voted out of House 5/7/13)
- 11. Discussion of next meeting date, location, and agenda items.
- 12. Adjourn

Further information, questions, or comments concerning any aspect of this meeting should be directed to Mr. Paul R. Nelson of Lone Star Groundwater Conservation District, 655 Conroe Park North Drive, Conroe, TX 77303; pnelson@lonestargcd.org, or (936) 494-3436.

As required by Section 36.108(e), Texas Water Code, a meeting of the Groundwater Management Area 14 Joint Planning Committee, comprised of representatives from the following groundwater conservation districts located wholly or partially within Groundwater Management Area 14: Bluebonnet GCD, Brazoria County GCD, Lone Star GCD, Lower Trinity GCD, and Southeast Texas GCD will be held on Wednesday, June 24, 2015, at 9:00 am at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303.

At this meeting, the following business may be considered and recommended for Joint Planning Committee action:

- 1. Call to order
- 2. Welcome and Introductions
- 3. Public Comment

(Public comment is limited to a maximum of 5 minutes per speaker and/or 30 minutes total for all speakers)

- 4. Receipt of Posted Notices
- 5. Discussion and possible action to approve minutes of May 28, 2015 GMA 14 Joint Planning Meeting.
- 6. Presentation of information from the Texas Water Development Board and discussions of items of interest to the GMA.

- Discuss funding levels, participation and any other aspects for the Interlocal Agreement and take possible action.
- 2. Briefing by contracted consultants regarding any DFC options requested in writing and by a District Representative for formal consideration during the GMA 14 joint planning meeting in accordance with GMA 14 Administrative Procedures, Sections 3.01 3.02.
- 3. Review and discussion of the statutory criteria considered by GMA 14 as set forth in Texas Water Code Section 36.108(d)(1)-(9) and in accordance with the GMA 14 Administrative Procedures.

- 4. Discussion and possible action to approve any DFC options and amended DFC options submitted to GMA 14 by a District Representative to be formally considered in accordance with GMA 14 Administrative Procedures, Section 3.03.
- Discussion and possible action to approve any DFC options currently under formal consideration to be further reviewed as candidates for evaluation in accordance with Texas Water Code Section 36.108
 (d) (1)-(9) in accordance with GMA 14 Administrative Procedures, Section 3.04.
- 6. Discussion and possible action to approve an eligible DFC option as the proposed DFC as required by Texas Water Code Sections 36.108 (d) and (d-2) and in accordance with GMA 14 Administrative Procedures, Section 3.05.
- 7. Briefing and discussion of progress to date for Groundwater Management Area 14 Joint Planning and remaining requirements and schedule.
- 8. Presentation and discussion by Districts of recent activities of interest or impacting the GMA 14 planning group.
- 9. Discussion of next meeting date, location, and agenda items.
- 10. Adjourn

Further information, questions, or comments concerning any aspect of this meeting should be directed to Mr. Paul R. Nelson of Lone Star Groundwater Conservation District, 655 Conroe Park North Drive, Conroe, TX 77303; pnelson@lonestargcd.org, or (936) 494-3436.

GROUNDWATER MANAGEMENT AREA 14 JOINT PLANNING COMMITTEE MEETINGS

NOTICE OF OPEN MEETING

As required by Section 36.108(e), Texas Water Code, a meeting of the **Groundwater Management Area 14 Joint Planning Committee**, comprised of representatives from the following groundwater conservation districts located wholly or partially within Groundwater Management Area 14—Bluebonnet GCD, Brazoria County GCD, Lone Star GCD, Lower Trinity GCD, and Southeast Texas GCD—will be held on **Friday, April 29, 2016**, at 9:00 **A.M.** at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303.

At this meeting, the following business may be considered and recommended for Joint Planning Committee possible action:

- 1. Call to order
- 2. Welcome and Introductions
- 3. Public Comment

(Public comment is limited to a maximum of 5 minutes per speaker and/or 30 minutes total for all speakers)

- Receipt of Posted Notices
- 5. Discussion and possible action to approve minutes of October 28, 2015 GMA 14 Joint Planning Meeting

Meeting will be convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

6. Discussion consideration and possible action regarding amending WO 3 for joint planning activities during the current round of joint planning, and any appropriate budget amendments for GMA 14 Interlocal Agreement participants that may be necessary or required.

GMA 14 Joint Planning Interlocal Agreement Participants meeting will be adjourned.

Meeting will be reconvened as a meeting of the GMA 14 District Representatives only.

- 7. Discussion and possible action approving resolution adopting Desired Future Conditions for the relevant aquifers in GMA 14.
- 8. Discussion and possible action authorizing GMA 14 Chair and the contracted consultant, on behalf of the GMA 14 District Representatives, to submit the explanatory report and all other required documentation regarding submission of adopted Desired Future Conditions to the Texas Water Development Board and authorizing the GMA 14 Chair to make any minor, technical, or grammatical changes consistent with the DFCs adopted prior to submission.
- 9. Adjournment of Joint Planning Meeting of GMA 14 District Representatives.

(The GMA 14 District Representatives will convene in a separate meeting, as posted on the following page, at 11:00 A.M or fifteen minutes after adjournment of the 9:00 A.M. meeting, whichever is later).

NOTICE OF OPEN MEETING

As required by Section 36.108(e), Texas Water Code, a meeting of the Groundwater Management Area 14 Joint Planning Committee, comprised of representatives from the following groundwater conservation districts located wholly or partially within Groundwater Management Area 14—Bluebonnet GCD, Brazoria County GCD, Lone Star GCD, Lower Trinity GCD, and Southeast Texas GCD—will be held on Friday, April 29, 2016, at 11:00 A.M. or fifteen minutes after adjournment of the 9:00 A.M. meeting, whichever is later, at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303.

At this meeting, the following business may be considered and recommended for Joint Planning Committee possible action:

- 1. Call to order
- 2. Welcome and Introductions
- 3. Public Comment

(Public comment is limited to a maximum of 5 minutes per speaker and/or 30 minutes total for all speakers)

- Receipt of Posted Notices
- 5. Consider approval of the meeting minutes of the 9:00 A.M., Friday, April 29, 2016, meeting of the GMA 14 Joint Planning Committee.

GROUNDWATER MANAGEMENT AREA 14 JOINT PLANNING COMMITTEE MEETINGS

NOTICE OF OPEN MEETING

As required by Section 36.108(e), Texas Water Code, a meeting of the Groundwater Management Area 14 Joint Planning Committee, comprised of representatives from the following groundwater conservation districts located wholly or partially within Groundwater Management Area 14—Bluebonnet GCD, Brazoria County GCD, Lone Star GCD, Lower Trinity GCD, and Southeast Texas GCD—will be held on Friday, April 29, 2016, at 9:00 A.M. at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303.

At this meeting, the following business may be considered and recommended for Joint Planning Committee possible action:

- 1. Call to order
- 2. Welcome and Introductions
- 3. Public Comment

(Public comment is limited to a maximum of 5 minutes per speaker and/or 30 minutes total for all speakers)

- 4. Receipt of Posted Notices
- 5. Discussion and possible action to approve minutes of October 28, 2015 GMA 14 Joint Planning Meeting

Meeting will be convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

6. Discussion consideration and possible action regarding amending WO 3 for joint planning activities during the current round of joint planning, and any appropriate budget amendments for GMA 14 Interlocal Agreement participants that may be necessary or required.

GMA 14 Joint Planning Interlocal Agreement Participants meeting will be adjourned.

Meeting will be reconvened as a meeting of the GMA 14 District Representatives only.

- 7. Discussion and possible action approving resolution adopting Desired Future Conditions for the relevant aquifers in GMA 14.
- 8. Discussion and possible action authorizing GMA 14 Chair and the contracted consultant, on behalf of the GMA 14 District Representatives, to submit the explanatory report and all other required documentation regarding submission of adopted Desired Future Conditions to the Texas Water Development Board and authorizing the GMA 14 Chair to make any minor, technical, or grammatical changes consistent with the DFCs adopted prior to submission.
- 9. Adjournment of Joint Planning Meeting of GMA 14 District Representatives.

(The GMA 14 District Representatives will convene in a separate meeting, as posted on the following page, at 11:00 A.M or fifteen minutes after adjournment of the 9:00 A.M. meeting, whichever is later).

NOTICE OF OPEN MEETING

As required by Section 36.108(e), Texas Water Code, a meeting of the Groundwater Management Area 14 Joint Planning Committee, comprised of representatives from the following groundwater conservation districts located wholly or partially within Groundwater Management Area 14—Bluebonnet GCD, Brazoria County GCD, Lone Star GCD, Lower Trinity GCD, and Southeast Texas GCD—will be held on Friday, April 29, 2016, at 11:00 A.M. or fifteen minutes after adjournment of the 9:00 A.M. meeting, whichever is later, at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303.

At this meeting, the following business may be considered and recommended for Joint Planning Committee possible action:

- Call to order
- 2. Welcome and Introductions
- 3. Public Comment

(Public comment is limited to a maximum of 5 minutes per speaker and/or 30 minutes total for all speakers)

- 4. Receipt of Posted Notices

As required by Section 36.108(e), Texas Water Code, a meeting of the Groundwater Management Area 14 Joint Planning Committee, comprised of representatives from the following groundwater conservation districts located wholly or partially within Groundwater Management Area 14—Bluebonnet GCD, Brazoria County GCD, Lone Star GCD, Lower Trinity GCD, and Southeast Texas GCD—will be held on Friday, April 29, 2016, at 11:00 A.M. or fifteen minutes after adjournment of the 9:00 A.M. meeting, whichever is later, at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303.

At this meeting, the following business may be considered and recommended for Joint Planning Committee possible action:

- 1. Call to order
- 2. Welcome and Introductions
- 3. Public Comment

(Public comment is limited to a maximum of 5 minutes per speaker and/or 30 minutes total for all speakers)

- 4. Receipt of Posted Notices
- 5. Consider approval of the meeting minutes of the 9:00 A.M., Friday, April 29, 2016, meeting of the GMA 14 Joint Planning Committee.
- 6. Adjournment of Joint Planning Meeting of GMA 14 District Representatives.

Further information, questions, or comments concerning any aspect of the above meeting(s) should be directed to Mr. Paul R. Nelson of Lone Star Groundwater Conservation District, 655 Conroe Park North Drive, Conroe, TX 77303; pnelson@lonestargcd.org, or (936) 494-3436.

Come to hand and posted on a Bulletin Board ir day of April, 2016, atm.	n the Courthouse, County, Texas, on this, the
	/s/ Kathy Turner Jones Kathy Turner Jones, Chairman GMA 14 Planning Group

APPROVED MINUTES

UPPER GULF COAST AQUIFER PLANNING AREA (GMA 14)

Joint Planning Group Meeting

Wednesday, April 24, 2013 9:30 AM

MEETING MINUTES

A regular meeting of the Upper Gulf Coast Aquifer Planning Area (GMA 14) was held Wednesday, April 24, 2013, at 9:30 a.m., in the board room of the Lone Star Groundwater Conservation District located at 655 Conroe Park North Drive, Conroe, Texas.

The meeting was called to order by Kathy Turner Jones (Lone Star GCD) at 9:30 a.m. District representatives introduced themselves. Districts represented included: Lone Star GCD, Bluebonnet GCD, Lower Trinity GCD, Brazoria County GCD, Southeast Texas GCD, and Brazos Valley GCD. Also, in attendance at said meeting were: Temple McKinnon and Sarah Backhouse with the TWDB, Ron Neighbors with the Harris Galveston Subsidence District, Robert Thompson with the Ft. Bend Subsidence District, Washington County Judge John Brieden, Washington County Commissioner Kirk Hannah, Bill Mullican with Bill Mullican, Associates and Jason Afinowicz-Freese and Nichols, Inc. (see Attachment "A" for a list of attendees).

Members discussed approval of the meeting minutes of the April 25, 2012, Joint Planning Group Meeting. Without further discussion, upon a motion by Kent Burkett (Brazoria County GCD), seconded by John Martin (Southeast Texas GCD) and unanimously carried, the meeting minutes for April 25, 2012, were approved.

Sarah Backhouse with the Texas Water Development Board gave a brief update of current items of interest to the GMA. The TWDB has compiled a groundwater management plan summary spreadsheet which is available on the TWDB website. The TWBD is still in the process of preparing a guidance document for defining the term "relevant", and by association, the term "non-relevant" and providing information on how the TWBD will calculate recoverable storage. Ms. Backhouse passed out a guidance document on how to submit DFC runs, including format and materials which must be included and concluded her report by informing the Group that the Board is also working on a guidance document for the explanatory report.

A copy of the current financial report was provided to the participants. .

Mr. Zach Holland (Bluebonnet GCD) then updated the GMA on the ten (10) applications before the Bluebonnet GCD, totaling 20 MGD, 10 MGD of which is proposed to be transported to Ft. Bend County for use by the cities of Richmond and Rosenberg. Mr. Holland further reported that the GCD would be objecting to the transport of water outside the boundaries of the GCD and to date has received some 250 letters of concern. Bluebonnet intends to address the effect of these proposed permits on 1) subsidence, 2) existing wells and 3) DFC's.

Jason Afinowicz of Freese Nichols then gave a PowerPoint presentation on the Regional Groundwater Modeling update efforts recently completed by the Harris Galveston and Ft Bend Subsidence Districts in conjunction with the LSGCD. The focus of Mr. Afinowicz's presentation was the effects of the findings of this study on the GMA 14 (DFC's and water demands) and the path forward with the GMA and TWDB to rectify any discrepancies created with the new data. Mr. Afinowicz told the GMA that the population study results and the new Gulf Coast Model had been delivered to the TWDB for their consideration and approval/adoption.

Following Mr. Afinowicz' presentation, Mr. Bill Mullican, of Bill Mullican Associates, provided an overview of the GMA 14's requirements under Senate Bill 660. Mr. Mullican stated that the process of adopting DFC's would be more complex and will now include an "explanatory report"; this report being necessary to justify adopted DFC's if the process is later questioned. Mr. Mullican added the following considerations that will have to be addressed:

Total estimated recoverable groundwater left in the aquifer Spring flows Impacts on subsidence Regional Water Plan and socio-economic impacts Effect of DFC's on private property rights reality of achieving DFC's once adopted

Mr. Mike Turco of USGS was called upon to discuss the new Gulf Coast model and explained that the major difference between the old model and the new was the increase in the amount of data, especially from the Jasper, that was available for input in this most recent effort.

Kent Burkett (Brazoria County GCD), then raised the issue of procuring a consultant for the next round of DFC's and the coordination between Region H Planning Group and GMA 14. John Martin (Southeast Texas GCD) raised the possibility of seeking bids for these professional services in an effort to make certain that the GMA received a competitive cost estimate for the proposed work. It was explained to the group that while multiple statements of qualification could be solicited, the law did not permit the selection of professional services (engineering) by competitive bid.

After discussion, it was determined by the Planning Group that Freese Nichols and Bill Mullican should provide a scope of work for review and consideration by the Group and that that document should be presented to the GMA at the next meeting. The motion to do so was approved unanimously.

Alan Day (Brazos Valley Groundwater Conservation District) then presented a resolution requesting the Joint Planning Group's support of the reassigning of a portion of the Brazos Valley Groundwater Conservation District that is currently in GMA 14 to GMA 12 by the Texas Water Development Board. After discussion, the motion to support was unanimously approved.

Discussion was made to set date and time for next meeting. A meeting was scheduled for Wednesday, May 22, at 10:00 am in the LSGCD Board Room. Each District will be notified.

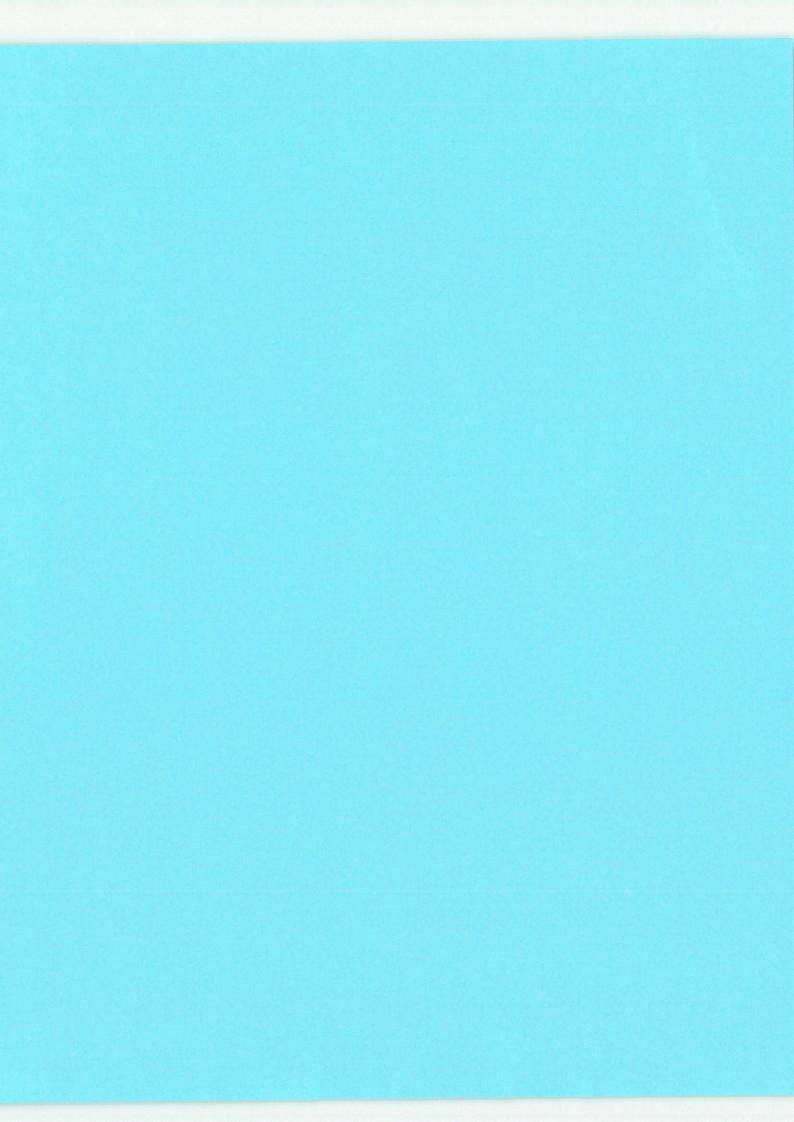

Without further discussion and there being no further business, the meeting was adjourned at 11:34 a.m.

PASSED, APPROVED, AND ADOPTED THIS 22th day of May, 2013.

Secretary

UPPER GULF COAST AQUIFER PLANNING AREA (GMA 14)

Joint Planning Group Meeting

Wednesday, May 22, 2013 10:08 AM

MEETING MINUTES

A regular meeting of the Upper Gulf Coast Aquifer Planning Area (GMA 14) was held Wednesday, May 22, 2013, at 10:08 a.m., in the board room of the Lone Star Groundwater Conservation District located at 655 Conroe Park North Drive, Conroe, Texas.

The meeting was called to order by Kathy Turner Jones (Lone Star GCD) at 10:08 a.m. District representatives introduced themselves. Districts represented included: Lone Star GCD, Bluebonnet GCD, Lower Trinity GCD, Brazoria County GCD, and Southeast Texas GCD. Brazos Valley GCD was not represented. Also in attendance at said meeting were: Larry French, David Bradley, and Shirley Wade with the TWDB, Ron Neighbors, Harris Galveston Subsidence District; Robert Thompson, Ft. Bend Subsidence District; The Honorable John Brieden, Washington County Judge; "Pudge" Willcox, Chambers County; Bill Mullican, Mullican and Associates; Jason Afinowicz, Freese and Nichols, Inc.; and members of the public. (see Attachment "A" for a list of attendees).

Kathy Jones began the meeting with a brief overview of the makeup of GMA 14 and the relationship to the 7 other counties within the area that are not in GMA's, but have coordinated with GMA 14 in the past. Ms. Jones then called for all posted notices. The next agenda item was discussion and approval of the minutes from the meeting on April 24th. Upon a motion by Kent Burkett (Brazoria County GCD), seconded by John Martin (Southeast Texas GCD) and unanimously carried, the meeting minutes for April 24, 2013, were approved.

Larry French, with the Texas Water Development Board gave an update of current items of interest to the GMA. Mr. French informed the group that the Water Development Board is currently conducting a technical review of the Houston Area Groundwater Model ("HAGM"). He thanked USGS for its help during the review and stated that the request to the Board was that it adopt the new HAGM as the GAM for GMA 14. It is anticipated that the review will be completed by the end of June, at which time a draft of the recommendations and findings will be circulated to the GMA 14 member districts for comment. After comments are received and considered, the report will be finalized. Mr. French offered the Water Development Board's assistance during the GMA review period. Mr. Bradley, of the TWDB, then discussed the Estimated Total Recoverable Storage project. It is anticipated that this effort will be completed by the end of the year.

Ms. Jones then asked for discussion of any recent activities of interest to or impacting the GMA 14 process. Mr. Zach Holland (Bluebonnet GCD) reported that a preliminary hearing was held in Bellville on Monday (May 2) to receive public comment on the permits to transport water outside of the Bluebonnet GCD's boundaries and to start the process of setting up the evidentiary hearing by the State Office of Administrative Hearings ("SOAH"). The first such hearing is scheduled for July 11 in Bellville.

Ms. Jones then asked Mr. Greg Ellis, the attorney representing the subsidence districts, to provide an update of any legislative highlights. Mr. Ellis reported that much was still in a state of flux; however, a bill raising the daily per diem for water conservation district board directors had been approved by both the House and Senate. The brackish groundwater bills have died and many other water bills will more than likely not make it before the deadlines to consider. Rules were suspended by the House to hear SJR 1, which would provide for a constitutional amendment to set up payments from the "rainy day" fund to other purposes including 2 billion dollars to water infrastructure. If the resolution carries, it will be subject to voter approval in November. Mr. Ellis then spoke about HB 4, which creates the water infrastructure fund and reorganizes the leadership of the Texas Water Development Board. A discussion of brackish groundwater and related bills followed. Mr. Mullican added that SB 1282 passed, resulting in the new deadline for submittal of DFC's being May of 2016. Mr. Mullican then explained the significance of the bill and new deadline to GMA's and the DFC process. He also stressed the importance of the DFC process and brackish waters and stated that he felt the groundwater districts needed to be proactive.

Meeting convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

The meeting was then turned over to Paul R. Nelson (Lone Star GCD), and at 10:44 AM the GMA 14 Planning Interlocal Agreement Participants meeting was called to order.

A copy of the current financial report was provided to the participants. Mr. Nelson then went over the makeup of the Interlocal Agreement Participants (the "Participants"), which consisted of the 6 GMA 14 Districts, the participating counties, as well as the 2 subsidence districts. Mr. Nelson stated that the group would move forward under the premise that the group is intact and will remain in place for the purpose of accomplishing the current tasks required of the GMA.

Mr. Nelson then provided the Participants present with copies of 2 versions of the Interlocal Agreement, one copy being a reproduction of the document executed by the Participants during the last DFC process and the other being an edited copy provided by Mr. John Martin (Southeast Texas GCD). It was the decision of the Participants that the amendments proposed by Mr. Martin be reviewed individually and either voted in or out or altered until acceptable by the group. Mr. Zach Holland (Bluebonnet GCD) then made a motion to accept the changes approved by the group, to make appropriate changes to the address pages, and provide language addressing the creation of a special committee to participate in receiving information from the engineering consultant. The motion was seconded by Mr. Bill Jacobs (Lower Trinity GCD) and carried unanimously.

A discussion of the process of selecting consultants then ensued. It was agreed upon that the "contracting entity" (LSGCD) would be responsible for entering into a contract for services with the contractors and that selection would be made by identifying the most qualified respondent and at a price acceptable to the contracting agency. Judge Brieden then made a motion that Lone Star GCD be the contracting entity. The motion was seconded by Zach Holland (Bluebonnet GCD) and was carried unanimously.

Jason Afinowicz then made a presentation to the participants giving an overview of the Freese-Nichols proposal and an explanation of why the estimated cost for the work significantly exceeded similar work done during the establishment of the last DFC's. Mr. Afinowicz told the participants that much of the increase is due to the increased technical demands (model runs, subsidence, explanatory report, etc.) that are now required and that much of the expense (model runs) of the last effort was borne by the TWDB. The TWBD no longer has the resources available to assist and will no longer provide model runs to the GMAs. Mr. Afinowicz also stated that the cost could be reduced by limiting the number of model runs, coordinating the number of meetings required, and removing all redundancies between their current proposal and Mr. Mullican's submittal.

A general discussion of the redundancies between the two submittals and ways that the costs might be lowered followed. The number of models required, the number of meetings that will be necessary, and the other requirements that must be met in order to meet the established deadlines were addressed. Following these discussions, a motion was made by Kent Burkett (Brazoria County GCD) to approve Lone Star GCD to negotiate a contract with Freese and Nichols, Inc. and Mullican and Associates. The motion was seconded by Zach Holland (Bluebonnet GCD) and carried unanimously.

Kathy Jones told the group that negotiations would start as soon as possible and urged all members to go back to their respective governing bodies to seek approval of the Interlocal agreement and their participation levels. Mr. Afinowicz stated that the proposed funding level could be reduced by at least 20% and perhaps more, depending on the number of model runs and other technical requirements. Mr. Mullican added that the number of meetings required would have a significant impact on the final budget. It was also determined that the next meeting would include an in depth overview of the existing model results and that a working schedule would be established.

Kathy Jones announced members of the "Special Committee" to participate in receiving information from the engineering consultant consist of Kathy Turner Jones (Lone Star GCD), Kent Burkett (Brazoria County GCD), and Ron Neighbors (Subsidence Districts).

After additional discussion of the reasons the DFC's must be "re-established" and the importance of the DFC's to both the GCD's and the counties, the meeting of the GMA 14 Joint Planning Interlocal Agreement Participants was declared adjourned at 12:15 PM.

The GMA 14 Joint Planning Committee Meeting was re-opened. Ms. Jones stated that an item to fill the vacant Secretary position would be on the agenda for the next meeting.

Discussion was held to set the date and time for next meeting. A meeting was scheduled for Wednesday, June 26, at 10:00 AM in the LSGCD Board Room. Each District will be notified.

Without further discussion and there being no further business, the meeting was adjourned at 12:25 pm.

PASSED, APPROVED, AND ADOPTED THIS 26th day of June, 2013.

UPPER GULF COAST AQUIFER PLANNING AREA (GMA 14)

Joint Planning Group Meeting

Wednesday, June 26, 2013 10:08 AM

MEETING MINUTES

A regular meeting of the Upper Gulf Coast Aquifer Planning Area (GMA 14) was held Wednesday, June 26, 2013, at 10:08 a.m., in the board room of the Lone Star Groundwater Conservation District located at 655 Conroe Park North Drive, Conroe, Texas.

The meeting was called to order by Kathy Turner Jones (Lone Star GCD) at 10:08 a.m. District representatives introduced themselves. Districts represented included: Lone Star GCD, Bluebonnet GCD, Lower Trinity GCD, Brazoria County GCD, Southeast Texas GCD and Brazos Valley GCD. Also in attendance at said meeting were: Larry French, and Sarah Backhouse with the Texas Water Development Board (TWDB), Ron Neighbors, Harris Galveston Subsidence District; Robert Thompson, Ft. Bend Subsidence District; The Honorable John Brieden, Washington County Judge; "Pudge" Willcox, Chambers County; Bill Mullican, Mullican and Associates, Jason Afinowicz and Bill Thaman with Freese and Nichols, Inc., Mark Evans, Chair of the Region H Planning Group; and members of the public. (see Attachment "A" for a list of attendees).

Kathy Jones began the meeting by asking for all present to introduce themselves and then called for any public comment. Having no one signed up to speak, Ms. Jones then asked for consideration of the approval of the minutes from the GMA 14 meeting of May 22, 2013. After discussion and upon a motion by Kent Burkett (Brazoria County GCD), seconded by Bill Jacobs (Lower Trinity GCD), the minutes for the May 22, 2013 meeting were approved. John Martin (Southeast Texas GCD) abstained from the vote,

Sarah Backhouse (TWDB) then distributed a new guidance document, providing information on how the TWDB will use official aquifer boundaries to estimate the recoverable storage and modeled available groundwater, what additional information the GMA needs to provide if aquifers are declared non-relevant, and what the DFC statement should include (identifying the aquifer, baseline year, and timetable). Mr. French (TWBD), then informed the group that the analysis of the Houston Area Groundwater-Model had been completed and that a "preview" or draft copy of their findings had been presented to the USGS for their review and final comments. Mr. French stated that the overall analysis is that the Houston Area Groundwater Model is an improvement over the existing GAM. It is anticipated that the discussions with the USGS will be completed within a few weeks and at that time a final draft of findings will be given to the GMA 14 member districts for their review, comment, and questions as a part of the stakeholder process

in adopting the new model. Upon conclusion of that review and comment period, the TWDB will publish a final report.

Ms. Jones then called for nominations for the vacant position of Secretary of the GMA 14 Joint Planning Group. Mr. Kent Burkett (Brazoria County GCD) nominated Mr. Zach Holland (Bluebonnet GCD) for said position. Hearing no other names, the nomination was seconded by Mr. Bill Jacobs (Lower Trinity GCD) and approved unanimously.

Meeting convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement P

The GMA 14 Planning Interlocal Agreement Participants meeting was called to order at 10:29 am.

Ms. Jones discussed the revised Interlocal Agreement that had been distributed to all GCDs and participating counties. Ms. Jones pointed out that the agreement contained the scopes of work for the consultants that had been revised since the last meeting. These revisions reflected the efforts to eliminate any duplications of effort between the 2 consultants, and broke down Freese and Nichols, Inc.'s effort into 2 phases. Phase I reflects a minimal cost to proceed with the process and contained no new model runs. Phase II would be initiated if it were determined that a new model run was required and the means of how to fund Phase II would be discussed when and if it were determined that additional work was necessary. Ms. Jones then discussed the preliminary recommendation of proposed contributions by the participants, totaling \$51,560. Discussions of the need for Phase II and the product of Phase I ensued between the Participants and the Consultants. Ms. Jones suggested that the 2 presentations on technical findings that were on the agenda be presented by Freese and Nichols prior to a continuation of the discussion of work phasing and funding.

Prior to those presentations, Mr. Bill Mullican of Mullican and Associates, told the Participants that the presentation that was to be made by Freese and Nichols contained information that was a prescribed part of Chapter 36.108 and is actually 2 different parts of the DFC process. He further stated that 36.108, parts (b) and (c), speak to what GMA's, during the joint planning process, should do on an annual basis, as well as to the review of management plans and looking at the best available science. Mr. Mullican also stated that 36.108 (d) requires that district representatives in a GMA, in a joint planning meeting, propose DFC's and then take those proposed DFC's through a process of 9 points of consideration before finally voting on proposed DFCs. Next, the DFC's will go out to the GCDs for public hearings. Looking at this particular model run is the first step in the process; deciding whether or not the DFC's resulting from the model that these are the DFC's the group wants to take through the consideration process, or if there is additional work that the group wants to do before the list is finalized. Mr. Mullican further stated that to go back to adjust proposed DFC's would require additional consideration of the 9 elements contained in 36.108(d)(1-9). He then told the group that with the presentation, the group was complying with 36.108 (d),

Jason Afinowicz of Freese and Nichols, Inc., then distributed a spreadsheet detailing all of the available layers in the Gulf Coast Aquifer and summarizing those layers by groundwater

conservation district and by county. The data contrasted pumpage from the current TWDB GAM runs (from TWDB GAM Run 10-023, Scenario 3) from the last GMA joint-planning process (that concluded in 2010) with the pumpage and drawdown data from the most recent model (Houston Area Groundwater Model). Mr. Afinowicz then went through the various counties to demonstrate the differences in the results in the 2 models. He also noted that the new model (the Houston Area Groundwater Model) was done with a focus on a 5 county area (Brazoria, Fort Bend, Galveston, Harris, and Montgomery counties), and that no changes in pumpage or population/demand projections were applied to the counties and/or GMA's outside of those boundaries. A relatively direct comparison of the two models based on pumping projections from 2010 – 2060 was presented. Notable differences in drawdowns and pumping levels were noted for several counties in the GMA but outside the 5 county area of focus. Mr. Mullican added that the simplest and most straight forward way to approach this issue in the new model would be to take the pumping input files from GAM run 10-023 for all the counties except for the 5 counties considered in the most recent modeling effort and the modelers take the distribution of that pumping, which is what was agreed to during the last round of joint planning. Mr. Afinowicz pointed out that to adjust the pumpage to match a particular DFC would be very work intensive. The more direct method would be to review the pumpage figures and projected demands for each entity and once agreed upon, put those numbers into the model and determine the resulting DFC's.

A discussion of the budget summary sheet and suggested contributions then ensued. It was determined that with today's presentations and the work done to obtain the information presented, that the \$8,000 Phase I was completed. It was further determined that in order to complete the technical support for the DFC process, the Freese and Nichols, Inc. Phase II work will need to be done. The fee for that work, included in the Interlocal agreement, is "not to exceed" \$65,000. This scope of work did not include any model runs. It was the consensus of the group that at a minimum, one model run, using the parameters discussed above, would be required and it was estimated that such a run would require the expenditure of approximately \$14,000. The budget to perform Phase I and Phase II, as well as the model and the scope submitted by Mullican and Associates was determined to total \$129,000.

Once accepted by the group, Ms. Jones then led a discussion regarding how those costs should be equitably distributed. After discussion, it was the determination of the participants that Phase I and II costs (which includes Mr. Mullican's fee) would be distributed to the various GCD's, counties and subsidence districts based on an agreed upon percentage basis. It was further determined that the Lone Star GCD and the subsidence districts would not participate in the funding of the required additional model run, as they had participated in the creation of the new Houston Area Groundwater Model (also referred to as the new Upper Gulf Coast GAM). It was also decided that the additional model run would be funded based on county participation, therefore individual counties would pay a pro rata share of the total cost and the GCD's, other than Lone Star GCD, would pay shares based on the number of counties within their jurisdiction. Upon a motion made by Kent Burkett and seconded by Zach Holland, the proposal to divide the expenses as described above was unanimously approved by the participants. A copy of the breakdown of the distribution of budget contributions is attached hereto as *Attachment "B*.

After further discussion relative to approval of the Interlocal Agreement and funding schedule by the affected boards and commissioner courts, the GMA 14 Joint Planning Interlocal Agreement Participants was declared adjourned at 11:37 AM.

The GMA 14 Joint Planning Committee Meeting was re-opened. Larry French, of the TWDB gave a brief summary of the governance changes that would take place as a result of House Bill 4.

Discussion was held to set the date and time for next meeting. A meeting was tentatively scheduled for Wednesday, August 21, 2013, at 10:00 AM in the Lone Star GCD Board Room. Each District will be notified.

Without further discussion and there being no further business, the meeting was adjourned at 11:59 AM.

PASSED, APPROVED, AND ADOPTED THIS 18th day of September, 2013.

UPPER GULF COAST AQUIFER PLANNING AREA (GMA 14)

Joint Planning Group Meeting

Wednesday, September 18, 2013 9:10 AM

MEETING MINUTES

A regular meeting of the Upper Gulf Coast Aquifer Planning Area (GMA 14) was held Wednesday, September 18, 2013, at 9:10 a.m., in the board room of the Lone Star Groundwater Conservation District located at 655 Conroe Park North Drive, Conroe, Texas.

The meeting was called to order by Kathy Turner Jones (Lone Star GCD) at 9:10 a.m. District representatives introduced themselves. Districts represented included: Bluebonnet GCD, Brazoria GCD, Lone Star GCD, Lower Trinity GCD and Southeast Texas GCD. Also in attendance at said meeting were: Larry French and Sarah Backhouse, Texas Water Development Board (TWDB); Ron Neighbors, Harris-Galveston Subsidence District; Robert Thompson, Fort Bend Subsidence District; The Honorable John Brieden, Washington County Judge; 'Pudge' Willcox, Chambers County; Bill Mullican, Mullican and Associates; Jason Afinowicz and Bill Thaman, Freese and Nichols, Inc.; Mark Evans, Chair of the Region H Planning Group; and members of the public (see Attachment "A" for a list of attendees).

Kathy Turner Jones began the meeting by asking for a roll call of GMA 14 participating members and any comments. Ms. Jones proceeded with receipt and requests of posted notices from the group. Ms. Jones asked for consideration of the approval of the minutes from the GMA 14 meeting on June 26, 2013. After discussion and upon a motion by Ms. Jones (Lone Star GCD), seconded by Bill Jacobs (Lower Trinity GCD), the minutes for the June 26, 2013 meeting were approved unanimously.

Sarah Backhouse (TWDB) then distributed a new guidance document, providing information on the explanatory report of the desired future conditions (DFC) which summarized information needed for submission in the final DFC package to the TWDB. The guidance document also provided a quick reference and possible examples for inclusion in the explanatory report. Mr. French (TWDB), added that the TWDB has received a formal request from Brazos Valley GCD to be removed from GMA 14. Two options being considered are (1) staff and executive administrator approval of the request or (2) formal board approval, which would occur in October. According to Mr. French, there should not be any hindrance to moving the action to approval. Ms. Jones asked if additional action by the GMA was required. Mr. French answered that nothing should change with GMA 14 except that Brazos Valley GCD will no longer attend or be listed in GMA 14. Mr. French then updated the group on the Houston Area Groundwater Model as TWDB has received requests to consider it as the official groundwater availability model (GAM). Mr. French then went through the TWDB's review process of comparing the old GAM with new GAM. Findings have now been distributed to the group and posted on the TWDB website. The review and comment period is open through September 30, 2013 but the Minutes - GMA 14 Plan Group 09/18/13 Page 1 of 4 TWDB has had informal, external requests to extend that period, which should be granted. There were some specific comparisons requested by Southeast Texas GCD to review differences in models. Through that review, TWDB encountered some anomalies in a non-district area, San Jacinto County, and the TWDB has reached out to USGS for adjustments which have been made. According to Mr. French, the review process has been good and will result in a better model. Based on current efforts and timelines, the HAGM should be approved in the next month or so as the new GAM. Discussion opened about the HAGM with Mr. Neighbors (HGSD) inquiring specifically about the anomaly. USGS addressed the anomaly in San Jacinto County and how it was being corrected and documented. These changes do not require a full reevaluation through the review process, thus beginning anew is not required. Mr. French added that there has been great communication and exchange between TWDB and USGS and a good process for a good model.

Mr. Holland (Bluebonnet GCD) brought up points of discussion regarding his district's review of the models, turning the floor over to Dr. Bill Hutchison, Bluebonnet GCD consultant. Dr. Hutchison highlighted the pumping estimate differences as related to Bluebonnet GCD. Both models are the same from 1891 through 2000. HAGM deviates from DFCs quite a bit, presenting significant reductions in Bluebonnet GCD. The issue raised by Dr. Hutchinson is the different pumping regime in HAGM compared to the old GAM, which may have great effects on counties as it does in Bluebonnet GCD. Mr. Holland reiterated that this is information that Bluebonnet GCD had encountered that they wanted to make the group aware of. Dr. Hutchison added that neither model is right, just different, and needed to highlight those differences. Adjusting the pumping to the 10-023 GAM Run, as discussed in the June 26, 2013 meeting, should alleviate some differences, but will likely cause other changes as well. Kent Burkett (Brazoria County GCD) joined the meeting.

Meeting convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

The GMA 14 Joint Planning Interlocal Agreement Participants meeting was called to order at 9:41 a.m.

Ms. Jones discussed the funding levels and participation and other aspects of the Interlocal Agreement. Funding needed to complete the scope of work is \$129,000 and to date the collected/pledged funds equals \$112,000 from participant contributions. Discussion opened regarding options for making up the difference. Remaining balances from previous joint planning reduced the funding shortfall to \$13,000. A proposal for Lower Trinity GCD to seek \$3,500 and the other Districts to seek \$2,375 in FY 2015 funds to cover the costs was brought to the table. Further discussion ensued regarding likelihood of coming in under budget, and even asking Districts to participate in work efforts. There is still flexibility in place which will allow for completion of all tasks as efficiently as possible. Lone Star GCD offered to put together an addendum to or amendment of the Interlocal Agreement for the participants to take to their individual boards. Kent Burkett made the motion, seconded by Zach Holland and approved unanimously to have an addendum prepared by Lone Star GCD to budget request from Districts in Interlocal Agreement; \$3,500 for Lower Trinity GCD, and \$2,375 for Bluebonnet GCD, Brazoria County GCD, Lone Star GCD, and Southeast Texas GCD.

Minutes - GMA 14 Plan Group 09/18/13

Page 2 of 4

The floor opened to briefing and considerations of updated GAM using pumping scenarios developed for GAM Run 10-023 and for the updated Northern Gulf Coast GAM, impacts of proposed DFCs on aquifer uses or conditions including conditions that differ substantially from one geographic area to another in GMA 14 (as required by Texas Water Code 36.108 (d)(1)), and on water supply needs and water management strategies included in the 2012 Texas State Water Plan for GMA 14 (as required by Texas Water Code Section 36.108 (d)(2)). Jason Afinowicz of Freese and Nichols, Inc. discussed three sets of handouts regarding these considerations. Ongoing response period on the proposed HAGM is being followed to determine when the GAM run can be completed. Revisions to the model are the largest component of work that should be completed by the end of October. General changes being sought are pumping data inputs and Jasper layer updates. It is anticipated that by the next meeting the new DFCs resulting from agreed to pumping scenarios will be available for consideration by the group.

Phase III is directed to the nine factors for consideration in 36.108 (d) to be included in the explanatory report and their support for Bill Mullican of Mullican and Associates, efforts. Mr. Afinowicz referenced TWDB Water Use Database to address aquifer uses and conditions that differ from one area to another in the region. The primary time frame evaluated was the time period from 2000-2011. Illustrations of historic and type of water use were provided by county, by use sector, and by groundwater conservation district. Mr. Mullican emphasized that the data and information considered was important for memorializing the considerations mandated by statute. Questions were asked regarding the source of information included in the TWDB Water Use Database. Discussions focused on the purpose of the consideration of water use during the joint-planning process. It was explained that during the discussions of potential desired future conditions, both variations in water use and hydrologic conditions may influence decisions on potential desired future conditions.

Mr. Afinowicz then shifted from the water use discussion to aquifer conditions. Information for consideration centered on the existing GAM runs available. These overall conditions will have more detail later, As seen by Mr. Afinowicz and Mr. Mullican, this is the information required for consideration by the group to meet the requirements of Texas Water Code Section 36.108 (d) (1). Further modeling efforts will provide information required for consideration by Texas Water Code Section 36.108 (d) (3) (to be presented at a later date). At the conclusion of the presentation by Mr. Afinowicz on water use and aquifer conditions, GMA 14 Joint Planning Interlocal Agreement Participants then participated in a discussion of the impacts of water use and aquifer conditions on potential desired future conditions. It was noted that topography may have a significant impact on aquifer conditions as represented in the GAM, especially in the updip areas of the aquifer. The results from ongoing efforts regarding subsidence were also discussed, but it was noted that additional results would be provided in more detail later in the joint planning process after the updated HGAM is finalized. One question asked regarding the general aquifer conditions in GMA 14. Mr. Mullican responded that, as illustrated in the presentation, some areas of GMA 14 were stable while other areas are undergoing dynamic changes as illustrated by the current potentiometric surface of the aquifers. Other comments included (1) that there some isolated areas where issues exist but that the majority of the area is relatively stable, and that it will be up to local districts to address the local issues, (2) the planning process has its quirks but is working, (3) will the pumpage that comes out of the

process be something than can be achieved, (4) growth in population and water use will be an issue, (5) questions on how the groundwater availability estimates coming out of the process will be used to manage the resource, and (6) that only by limiting water level declines will we be able to address subsidence issues.

Mr. Afinowicz presented the water supply needs and water management strategies from the 2012 State Water Plan based on the planning horizon of 2010 - 2060 and broken down into counties similar to the breakdown of the aquifer use data. Total water demands and total water supply needs were described. Total demands represent the water demand projections for individual water user groups over the 50-year planning horizon and water supply needs result when the currently available water supply is less than the projected water demands for a water user group or a wholesale water provider. A question was raised regarding the difference in water demands and water supply needs. Further discussion of the actual strategies being completed or implemented from the 2012 State Water Plan opened. Questions regarding reuse in GMA 14 were raised and discussed. The need for implementation of Allen's Creek Reservoir was discussed. There was a substantive discussion focused on the strategies proposed for different needs for multiple counties. Mr. Mullican added that something that will be increasingly used and heard is 'project viability' when referencing projects in the State Water Plan due to House Bill 4 language intent and purpose. Mr. Neighbors commented that there is a flaw of relationships between the plan and the folks expected to implement solutions.

The GMA 14 Joint Planning Committee Meeting was re-opened. Mr. Mullican briefly brought up Proposition 6 regarding State Water Plan funding as part of the upcoming November elections.

Discussion was held to set the date and time for next meeting. It was unclear when the next meeting would be necessary, but wanted to block the third Wednesday of the month as it seems to work best in everyone's schedule. November would likely be the earliest meeting, but would be dependent on model work and formation of other mandated consideration and could slide later if necessary for a more meaningful and appropriate meeting. November 20, 2013, at 9:00 AM is tentatively scheduled as the next meeting in the Lone Star GCD Board Room and each interlocal participant will be notified.

Without further discussion and there being no further business, the meeting was adjourned at 11:59 AM.

PASSED, APPROVED, AND ADOPTED THIS 30 day of April , 2014

UPPER GULF COAST AQUIFER PLANNING AREA (GMA 14)

Joint Planning Group Meeting

Wednesday, April 30, 2014 9:00 AM

MEETING MINUTES

A regular meeting of the Upper Gulf Coast Aquifer Planning Area (GMA 14) scheduled for Wednesday, January 29, 2014, at 9:00 a.m., in the board room of the Lone Star Groundwater Conservation District located at 655 Conroe Park North Drive, Conroe, Texas was canceled due to inclement weather.

A regular meeting of GMA 14 scheduled for Wednesday, March 4, 2014, at 9:00 a.m., in the board room of the Lone Star Groundwater Conservation District located at 655 Conroe Park North Drive, Conroe, Texas was also canceled due to inclement weather.

A regular meeting of GMA 14 was held Wednesday, April 30, 2014, at 9:00 a.m., in the board room of the Lone Star Groundwater Conservation District located at 655 Conroe Park North Drive, Conroe, Texas.

The meeting was called to order by Kathy Turner Jones (Lone Star GCD) at 9:10 a.m. District representatives introduced themselves. Districts represented included: Bluebonnet GCD, Lone Star GCD, Lower Trinity GCD and Southeast Texas GCD. Also in attendance at the meeting were: Larry French, Texas Water Development Board (TWDB); Mike Turco, Harris-Galveston Subsidence District; The Honorable John Brieden, Washington County Judge; 'Pudge' Willcox, Chambers County; Bill Mullican, Mullican and Associates; Jason Afinowicz, Freese and Nichols, Inc.; and members of the public. Brazoria GCD and Robert Thompson, Fort Bend Subsidence District joined the meeting at 9:40 a.m. (see Attachment "A" for a list of attendees).

Kathy Turner Jones began the meeting by asking for a roll call of GMA 14 participating members and any comments. Ms. Jones proceeded with receipt and requests of posted notices from the group. Ms. Jones asked for consideration of the approval of the minutes from the GMA 14 meeting on September 18, 2013. After discussion and upon a motion by Zach Holland (Bluebonnet GCD), seconded by Bill Jacobs (Lower Trinity GCD), the minutes for the September 18, 2013 meeting were approved unanimously.

Meeting convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

The GMA 14 Joint Planning Interlocal Agreement Participants meeting was called to order at 9:14 a.m.

Ms. Jones recognized Mark C. Kasmarek, representing the U.S. Geological Survey, for a presentation of information on the approach, conceptual model, model development, model calibration, and review process for the Houston Area Groundwater Model (HAGM). Mr. Kasmarek documented updates to the model packages, simulation and water use period, and aquifer parameters utilized in the HAGM. These updates, though challenging to calibrate, demonstrate simulated and measured water levels agree well, in addition to agreement between simulated and measured land-surface subsidence in the areas participating in the development of the HAGM. While the new model does indicate simulated subsidence in the outlying districts, it does not provide any data regarding measured subsidence in these areas.

At the conclusion of the presentation, the floor opened to questions and discussion. Bill Mullican asked technical questions regarding the changes in hydraulic conductivity and inelastic and elastic storativity coefficients numbers and their basis. Mr. Mullican followed up with highlighting an issue being worked on and worked through by a subcommittee of TWCA, is the role of brackish groundwater in the DFC process, specifically regarding brackish groundwater volume estimates in the estimates of Modeled Available Groundwater (MAG). Referencing knowledge of brackish areas of the Gulf Coast Aquifer layers closer to the coast, the question was asked as whether or not the brackish areas truly isolated or are they in hydrologic communication with areas containing fresh groundwater. Mr. Kasmarek answered with a specific example in Galveston County with saltwater encroachment to freshwater wells, and actually some up-coning in areas pumping high volumes. As the pumping was reduced and water levels increased due to recharge in the management area, the saltwater wedge was relaxed and pushed back downdip. The brackish-freshwater interface is continually moving and in direct hydrologic communication. Mark Lowry of Lone Star GCD opined if you were to drill brackish wells it would result in pulling the interface further inland and diminishing quality. The proximity to the coast and amount of pumping will dictate how quickly the effects are realized, Mr. Kasmarek added. Mike Turco also added that the aquifer doesn't care about the quality, but that removing water from that matrix would still be limited based on subsidence. Larry French asked about the criteria used to define fresh and brackish water in the HAGM. Mr. Kasmarek noted 1,000 mg/L as the boundary definition of fresh groundwater. Mr. French followed up with the HAGM modeled beyond that definition. Mr. Kasmarek noted that this model is specific to the freshwater only and brackish groundwater would not have an estimate of MAG. The cells which are greater than the 1,000 mg/L are turned off in the model. The lack of calibration targets was also a factor to turn the cells off.

Mr. French was given the floor to present information from the TWDB of items of interest to GMA 14. First, since the last meeting, TWDB has a new board member. Kathleen Jackson came to the Board about 6 weeks ago from Beaumont. She is eager to hear from and interact with folks around the State. Second, TWDB should be completing and submitting a report to the GMA regarding the total estimated recoverable storage. This report is statutorily required for all of the management areas. The report is currently under management review and will give volumetric estimates for all relevant aquifers in the region. However, they will not address any issues related to subsidence or quality resulting from attempts to produce the water. Finally, TWDB approved the HAGM as the updated GAM in February 2014 and the HAGM is now the adopted model for the region. As part of that approval package, information of the initial request to consider the HAGM as the state's GAM and technical analysis between the previous model and HAGM are provided to outline and inform the reasoning on how the HAGM addresses the criteria and is a

better representation for joint planning purposes. In addition, Mr. French outlined the review process and responses to stakeholder comments.

Ms. Jones began discussion and briefing of the approach and results from the predictive simulations utilizing GMA 14 approved pumping amounts in the updated GAM (also referred to as the HAGM) by turning the floor to Jason Afinowicz of Freese and Nichols, Inc. Mr. Afinowicz noted the presentation would cover the next few agenda items, but all would be covered individually for comment and discussion. Discussion began with review of the GAM run simulation of drawdowns with the approved pumping for the region by GMA 14 members. The second part of moving forward with the simulations is using the GAM run to define desired future conditions (DFCs), which will be the cornerstone of the formulations needed in the explanatory report. Again, this GAM run utilized the updated GAM. As part of the model development, updated projections of pumping were developed for Fort Bend, Harris, Galveston, and Montgomery counties. These updated estimates were utilized in this initial predictive simulation and the rest of the region utilized pumping numbers from GAM Run 10-023. A series of figures demonstrating the drawdowns for the predicted periods were shown for review. Significant updates to aquifer parameters, pumping packages and simulation of predictive periods were noted for the model. Drawdown in the Chicot Aquifer demonstrated expected trends and impacts from pumpage and some aquifer parameter adjustments. Drawdown in the Evangeline Aquifer is somewhat more dramatic, indicative of the adjustments made to aquifer parameters during the model update process. The Burkeville Aquitard also illustrated these trends. As the Jasper Aquifer contained the greatest aquifer parameter and pumping adjustments, the largest variations were subsequently documented for the Jasper Aquifer. This resulted in all drawdowns being greater in all counties for the Jasper Aquifer in the updated GAM than in the previous GAM. Each county was highlighted as to their changes and alterations based on the new, updated GAM. In this initial predictive simulation, it was typical for the pumping projections to go from the currently measured pumping directly to the fixed projected pumping rather than a staged, phased, or gradual increase over the 50-year predictive period. There was also a handout package which detailed all of the pumping and drawdown simulations for the predictive periods for reference comparing the previous and new model simulations.

After this review of results from the updated model, Mr. Mullican began a discussion of the need for any adjustments and additional model simulations based on alternative scenarios. He noted the step function of pumping is having a cumulative effect on the drawdowns and DFCs. Mr. Mullican again specifically highlighted the stepped pumping function, in place for the majority of the area, could be addressed in a subsequent alternative scenario for later consideration. This item on the agenda was intended to allow anyone to ask additional questions of the updated GAM and the desire to revisit how the pumping was put into the predictive simulation to perhaps, at a minimum, change the way the pumping increases over time for the counties based on 10-023. John Martin of Southeast Texas GCD asked with all of his counties encountering significant changes between the models, was the old model that "bad or wrong" to give such differences. Mr. French explained there wasn't a function of the model being flawed, but an update and differences in the data used. He also mentioned the question of the stepped pumping function which the GMA may want to address and may yield some of the desirable changes and better agreement with previous drawdown predictions.

Mr. Martin also inquired if the districts could reference the old model or if they had to use the new model. Mr. French noted that the Board will only use the new model, and to keep the point of reference and comparison, the new model should be used. TWDB did consider allowing the individual districts to reference one model or the other for their DFC expressions, but it was decided that since they have to focus on things on a regional scale where one district could affect another, a consistent and uniform model across the region would be the most beneficial tool. Mr. Holland voiced that the changes in the model are attributable to changes in pumping or aquifer parameter and overall bettered the modeling process. In a recent Bluebonnet GCD Board meeting considering this model and its best use and incorporation for the district's objectives and goals (i.e. permitting considerations, preventing and controlling subsidence), Bluebonnet GCD wished to express their DFCs not only with drawdowns but also with a subsidence statement. In Bluebonnet GCD's opinion, a subsidence-based DFC would highlight one of the greatest tools of the model in the subsidence calibration. Mr. Holland acknowledged that this may be more appropriate for discussion in the next item, but "maximum allowable" language referencing and expressing subsidence as the most limiting impact was the wish of Bluebonnet. Mr Holland noted that although the district does not have extensometers to directly measure subsidence, incorporating the drawdown estimates into thresholds to ensure that conditions do not reach the limit of causing subsidence would be their strategy. Although projections of subsidence have not been provided to the GMA yet, Mr. Holland reported that Bluebonnet GCD has already performed this analysis, Mr. Afinowicz acknowledged that the numbers would be available in a future meeting regarding discussion of subsidence as part of the explanatory report criteria. Mr. Mullican stated that the 36.108 conditions require the GMA to consider the impacts of the proposed DFC on subsidence and asked for clarification that Bluebonnet GCD seeks subsidence to be a condition of the MAG also. Mr. Holland reiterated it was not a function of the MAG but an expression of the DFC. The expression would be for the entire county rather than the layerby-layer format used for the drawdown expressions. Mr. French added that it would definitely be a first, but there shouldn't be any reason why it couldn't be done. Mr. Holland further added that a subsidence based DFC would be consistent with the quantifiable criteria of a DFC, highlight the key components of the model, and emphasize the charge of a GCD to prevent subsidence. Mr. French illustrated that the creation of management zones would likely be the management path in implementing this type of DFC, Mr. Holland agreed.

Mr. Jacobs inquired about which model, HAGM or the old GAM, would be or should be used with his Management Plan which is due in January 2015. Mr. French replied that the HAGM would be expressly used. Mr. Jacobs again questioned the explanation to be given when the drawdowns have changed and district pumping has not. Mr. French echoed the previous discussion and Mr. Jacobs understanding of a different model produces different numbers, aquifer parameters and pumping changes outside of your district are the primary cause for the differences. Drawdowns are also relative to the point in time which you began or started the measurement. Mr. Jacobs would follow up and begin the dialogue regarding his Management Plan with the appropriate TWDB staff. Judge Brieden asked for further clarification on the implementation of the predictive pumping as it immediately jumps from measured to projected pumping rather than a staggered or gradual increase over the 50 year planning window. He

questioned if that process would over exaggerate the drawdown and other changes from the model. Mr. Afinowicz answered that it would certainly have an impact. Judge Brieden mentioned that Harris, Galveston, Fort Bend, and Montgomery counties have the gradual changes in pumping projections, while all others don't. Mr. Mullican added that the step function of pumping is how the model handles the numbers. It is okay in a way, but a gradual increase would reduce impacts. Another reason these numbers are important, currently, is that regional water planning relies solely on the MAG which has to be utilized for groundwater availability. This is the reason why the estimates of MAG really matter to local communities as they are the basis for availability and State funding assistance. The parameters that GMA 14 adopts as DFCs are correlated to the MAG and both must be evaluated. The step function does allow for more water to be available upfront in the current and future State Water Plan and could allow for the short term projects to get off the ground quicker. Reality is this is what makes the GMA process so much more interesting. The GMA must weigh the effects of the numbers, both predicted and simulated, on the region. Mr. French added the Board's high attention to this issue as it continues to be fleshed out and implemented. The conundrum is between the planning and the technical elements. As a district goes about managing groundwater resources, the MAG is one component of consideration. In regional planning, the MAG is a cap. The Board has pulled staff together to develop policies moving forward reacting to the frustration concerns and complaints from around the State on how these numbers will be used as they update previous plans. Dedicated review of the pumping, its step function, and implementation are critical to ensuring that the numbers will be beneficial. Unintended consequences are the goal to avoid, but what is being dealt with, not just here but around the State.

Mr. Mullican re-centered to further discussions regarding the model or the need for additional model runs. Lone Star GCD wishes to pursue an additional model run to better align the pumping package with the current regulatory plan for the district. The only changes will be those requested within those counties, others will keep their current pumping numbers. Mr. Martin expressed wanting to bring the entire model numbers up to 2013 from 2009. Mr. Afinowicz and Mr. French stated that would be a change to the model which would have to be tested, calibrated, peer reviewed and essentially start the entire process over. The changes and differences in the drawdowns will be even more varied, and for a very short time frame, would not add anything to the overall goal and project of the tool. Mr. Turco added that considerations should stay within the bounds of different scenarios of the model, rather than altering the model which again is simply a predictive tool. Mr. Martin expressed confusion on the difficulty of adding four years of pumping to improve the accuracy of the model. Mr. Afinowicz restated it wouldn't be hard, but gathering the data and the time used would not add much in the way of results from the current model. Before moving discussions forward, Mr. Mullican reiterated Lone Star GCD's interest in an additional model run and encouraged anyone else who may have or want changes to get their information in quickly so one additional predictive simulation can be done. Members were encouraged to contact Ms. Jones and Mr. Mullican with their intent or factors to consider. Mr. Martin inquired about the cost of additional model runs. Mr. Mullican noted they would be dependent on the extent of the model run but would only be the responsibility of those participating in the new model run. Mr. Afinowicz noted that the bulk of those costs would be in data collection and its addition. Ms. Jones suggested any who were interested to email their desired changes and allow Mr. Afinowicz to put together a specific cost estimate. Mr. Holland suggested

placing a deadline for changes to be submitted. Acknowledging communications which must occur at the district level and the meetings lost to weather, the deadline for the Participant's request was set for May 21, 2014 in an effort to get back on track with the heavy load to be covered.

Discussions transitioned to briefing and consideration of draft statement of DFCs based on execution of the updated GAM. The draft document provided by the consultants was referenced with the understandings that, at least partially, due to the additional model run that the specific DFC expressions would change. The consultants used the template from the last adoption of the DFC, additional language required by 36.108, and specific DFCs for the subsidence districts to reflect changes. Mr. Holland again voiced Bluebonnet GCDs desires for a subsidence-based DFC statement. He also asked the requirements for deeming aquifers non-relevant, specifically noting the alluvium aquifers in the district. Mr. French detailed that process and justification required. Mr. Mullican encouraged all of the Participants to thoroughly review their numbers and expressions to ensure they are relevant or if changes need to be made that action is taken to resolve those issues now. He also referenced a specific template in the TWDB rules which address Mr. Holland's inquiry. Questions were asked regarding the use of total estimated recoverable storage received from the Board. The numbers are one of the 36.108 factors of considerations, but the GMA has not received the numbers to date. Mr. French added that they were in the final stages of being approved and should be available soon.

The group moved their discussions onto a briefing of the process for GMA 14 agreement for proposed DFCs during joint planning process. Mr. Mullican began discussion referring to the changes in the joint planning process in SB 660 from the 2011 Legislative Session. He noted that the further we get into and through the process, the more questions and clarifications we stumble upon. Mr. Mullican noted that there are more things that we want to think about proactively, rather than reactively, with one of those being the discussion of all the conditions and alternatives considered but not adopted and an explanation, per 36.108(d-3). The concern raised is, what does that mean? What is formal and informal consideration? There seems to be a need for the GMA to establish these criteria to be on the same page. He turned the floor to Shauna Fitzsimmons of Sledge Fancher law firm. One of the main focuses is not limited to ensuring that adopted DFCs are properly documented through the explanatory report, but more importantly the documentation of the alternatives which were considered but not adopted. If there is no control over what constitutes consideration or alternatives, the explanatory report can become unwieldy and overly burdensome. Ms. Fitzsimmons stated that It will be critical for GMA 14 to adopt procedures which state the time and process for considering DFCs versus those just discussed. A bright line rule or test will determine formal and informal discussions regarding considerations of DFCs. Ms. Fitzsimmons stated that it is very important, legally, to understand what the explanatory serves as; an administrative record for everything the GMA works on. She continued by stating that you can't go through this process then produce an explanatory report after the fact, it must be a running record book of the process and the steps taken. The statute is unclear on the detail required or needed. It is the GMAs ability to set the boundaries for formal DFC adoption to help the defense of the DFCs adopted. The process should be clear cut and streamlined to ensure that the GMA has done everything necessary procedurally to prevent challenges to the DFCs based on this clarity issue. She noted that this is important for three reasons. First, we don't want to have holes in our explanatory report regarding the formality of

DFC considerations whether approved, denied, or discussed. Second, we want to steer away from having explanations informally discussed or considered as any discussions at the district level (i.e. district board, staff, consultants, attorneys, etc.), district to district, or district to GMA consultant. These criteria should be limited to discussions of the group and not an individual. Third, statements explaining considerations rejected must be careful not be used to discredit the adopted DFCs. Ms. Fitzsimmons used the example of agency rulemaking procedures. She proposed the GMA consider administrative procedures to be presented at the next GMA meeting and adopted by resolution to assist in this process. Ms. Jones added her support and highlighted the concerns and uncertainty of this process.

Discussion shifted to funding levels, participation, and any other aspects of the Interlocal Agreement. Updated financial documents of invoices and payments on work performed were presented by Ms. Jones. She reiterated that those participating in the additional model run would be responsible for those charges and would not affect or be factored into the current agreement. Also of note is the GMA shows a deficit for the overall task. Mr. Burkett proposed an allocation amendment to disperse the costs to those financially able to contribute additional funds be placed on the next agenda. Mr. Martin inquired if there would be additional costs from the consultants as there are phases which went over budget. Mr. Afinowicz stated that the budget and quote for the project would be final. Ms. Jones also suggested that all participants, districts especially, begin to budget a given amount every year to accrue the funds which will be necessary for future joint planning.

Recent activities of interest to or impacting the GMA 14 planning group were the focus of subsequent discussions. Mr. Holland documented that the contested case hearing before his district had been dismissed as the applications had been withdrawn in late January. Mr. Turco mentioned that as a follow up to the Bluebonnet GCD contested case hearing process, Fort Bend Subsidence District had been sued by parties related to that hearing. Mr. Holland added future rulemaking revisions the district would be undertaking in the near future. Ms. Jones furthered some clean up and clarification of Lone Star GCDs rulemaking and regulatory plan implementation. They have also audited their GRPs to ensure they are moving toward their goals of groundwater reduction. Mr. Nelson also announced an upcoming meeting of the Gulf Coast/Montgomery County Water Efficiency Network.

The GMA 14 Joint Planning Committee Meeting was re-opened at 11:37 AM.

Mr. Mullican gave a review of progress to date for the GMA 14 joint planning area. We have completed two of the nine consideration criteria, water use and water supply needs/water management strategies. Now that the HAGM is complete, the GMA can move forward to other criteria. The next meeting will have the results from that additional simulation, and three additional criteria considerations and the possibility of another. If there are any aquifers you don't have a DFC and you want one for this round of planning, we must get these addressed now. Alternatively, if you are looking to designations of non-relevant aquifers, we need to address these and get those into the proper format for the explanatory report. Mr. Martin inquired if there were non-relevant aquifers last time, do they need to be documented this round. Mr. Mullican recommended that if the source is a major or minor aquifer which has a DFC, it should

be documented. He requested that all those wishing to participate in an additional model run notify him by May 21, 2014.

A proposed date for the next meeting was discussed. Mr. Mullican suggested June 25, 2014. Mr. Martin inquired again about the storativity numbers being ready from the Board. Mr. French was confident the numbers would be available and dispersed before that meeting. Mr. Mullican added that if we can meet and tackle the lengthy and detailed agenda, we would be back on track after missing the last couple of meetings with only one or two criteria remaining to complete. Ms. Jones confirmed with consultants and Mr. French that June 25, 2014 at 9:00 AM was good, in addition to the districts and participants. She followed up a question on the length of meeting with Mr. Mullican. He mentioned that if he was able to include the extra criteria, the meeting would likely be longer than today's. Ms. Jones asked for any other agenda items which need to be addressed on future agendas. Mr. Burkett had finished an initial divvying of the remaining funding deficit and presented it to the group for initial consideration to be typed up for the next meeting. Mr. Willcox questioned if there was any way to require participation by non-GCD counties as this group sets numbers for them and yet they don't contribute. Mr. French stated that there isn't any way to require that participation. Discussion went into the efforts which have been undertaken to bring non-GCD areas to the table and the reason why GMA 14 set itself up accordingly. Mr. French suggested identifying water plan strategies tied to groundwater for those non-participating counties as a starter to understand where they may have a more direct link into this process. All counties and representatives are provided notice of all GMA 14.

Without further discussion and there being no further business, the meeting was adjourned at 12:00 PM.

PASSED, APPROVED AND ADOPTED THIS 24TH day of June, 2014

Joint Planning Group Meeting

Tuesday, June 24, 2014 1:30 PM

MEETING MINUTES

A regular meeting of GMA 14 was held Tuesday, June 24, 2014, at 1:30 PM, in the board room of the Lone Star Groundwater Conservation District located at 655 Conroe Park North Drive, Conroe, Texas.

The meeting was called to order by Kathy Turner Jones (Lone Star GCD) at 1:30 PM, at which time the district representatives introduced themselves. The districts represented at the Joint Planning Group meeting included: Brazoria County GCD, Bluebonnet GCD, Lone Star GCD, Lower Trinity GCD and Southeast Texas GCD. Also in attendance at the meeting were: Jason Afinowicz, Freese and Niehols, Inc.; The Honorable John Brieden, Washington County Judge; Larry French, Texas Water Development Board (TWDB); Bill Mullican, Mullican and Associates; Robert Thompson, Fort Bend Subsidence District; Mike Turco, Harris-Galveston Subsidence District; 'Pudge' Willcox, Chambers County; and members of the public. (see Attachment "A" for a list of attendees).

Kathy Turner Jones began the meeting by asking for a roll call of GMA 14 participating members and any comments. Ms. Jones proceeded with receipt and requests of posted notices from the group. Ms. Jones asked for consideration of the approval of the minutes from the GMA 14 Joint Planning Group meeting on April 30, 2014. Paul Nelson (Lone Star GCD) was given the floor to discuss amendments to the revised draft minutes. These amendments were to correct typos and clarification of discussions regarding subsidence and its calibration in the model. After discussion and upon a motion by Kent Burkett (Brazoria County GCD), seconded by John Martin (Southeast Texas GCD), the minutes for the April 30, 2014 meeting were approved unanimously, as amended.

Ms. Jones recognized Ms. Jill Savory for public comment to the Joint Planning Group. After thanking the group, she presented information she researched regarding empowering the people making decisions with consideration of scientific studies. These comments were also summarized in a passed out handout.

Ms. Jones moved to discussion and consideration of aquifers located in whole or in part in GMA 14 for which requests have been received for possible declaration as non-relevant aquifers for the purposes of joint planning. Bill Mullican led discussion of responses from Bluebonnet GCD, Lower Trinity GCD, and Southeast Texas GCD. Bluebonnet GCD requested declaration of the river alluvium aquifers (Brazos, Navasota, San Bernard, San Jacinto, and Trinity) in its district and the Brazos River alluvium aquifer in Washington County as non-relevant aquifers for the

purposes of joint planning. Lower Trinity GCD and Southeast Texas GCD requested declaration of the Yegua-Jackson Aquifer within their respective districts as non-relevant aquifers for the purposes of joint planning. Mr. Mullican stated he had received adequate information to document the declarations in the explanatory report if the Joint Planning Group took such action. Zach Holland made the motion to approve the requests by Bluebonnet GCD, Lower Trinity GCD, and Southeast Texas GCD of declaration of non-relevant aquifers for the purposes of joint planning. After a second by John Martin, the motion was approved unanimously.

Meeting convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

The GMA 14 Joint Planning Interlocal Agreement Participants meeting was called to order at 1:44 PM.

Ms. Jones recognized Larry French for an agency update. Mr. French noted the completion and distribution of the total estimated recoverable storage (TERS) numbers for the aquifers in GMA 14. Based on the aquifers with current DFCs, including those which were just approved to be declared non-relevant aquifers, TERS numbers were explained and broken down to aquifer, district, and county level summaries. Mr. French also explained the history of the TERS numbers and the limitations on their use as management tools. After some discussion, the participating members agreed that they would like to request a written explanation of these limitations from the TWDB.

Ms. Jones called for the briefing and consideration of results from the modified predictive simulation utilizing GMA 14 approved pumping amounts in the updated Northern Gulf Coast Aquifer. Jason Afinowicz updated the group on progress since the last meeting. He noted the nomenclature change to account for the updated GAM run as NGC GAM Run 2 (Run 2) to differentiate from the information considered at previous meetings. Run 2 was at the request of Lone Star GCD to revise pumping in the Lone Star GCD. Mr. Afinowicz provided maps and illustrations of the Run 2 results for consideration. Results from each county and each aquifer layer were detailed and outlined.

Ms. Jones next called for a briefing on draft statements of desired future conditions based on the execution of the updated NGC GAM Run 2. There were some additions made in relation to the Fort Bend and Harris-Galveston Subsidence Districts to represent their mission and goals. Also, as requested during the last GMA 14 meeting by Bluebonnet GCD, a subsidence DFC was added though the exact numbers will be confirmed when the subsidence numbers are extracted from the model run. Further changes would be needed for the aquifers declared non-relevant earlier in the meeting. At this point, this remains a draft document for further consideration.

Ms. Jones next called for a briefing and consideration of hydrological conditions, including for each aquifer in the management area, total estimated recoverable storage, average annual recharge, inflows, and discharge, as required by Texas Water Code Chapter 36.108(d)(3). Mr. Afinowicz restated a summary of the calculation of total estimated recoverable storage. This is a number documenting the volume of water in an aquifer. The number is a requirement for

consideration in statute. Mr. Afinowicz presented total estimated recoverable storage and water budget numbers by county and aquifer layer. Mr. Mullican reminded the group that water budget numbers will be implemented into future management plans for the districts. As this is part of the specific criteria to be considered and documented in the explanatory report, Mr. Mullican reiterated that if there is anything in addition to the information presented by Mr. Afinowicz that would be appropriate for further consideration, now would be the time to raise those to the group.

Next, Ms. Jones directed the group into a briefing and discussion of environmental impacts, including impacts on spring flow and other interactions between groundwater and surface water, as required by Texas Water Code Chapter 36.108(d)(4). Mr. Afinowicz presented available information from the models and limited other resources. Generally, there is limited interaction from the aquifer systems as a whole. However, shallower systems do have an interaction with surface water systems as documented and recognized specifically by the Lower Colorado River Authority, but that level of study has not been performed in GMA 14. In the Carrizo, Queen City, and Sparta aquifers, there is some information included in the Carrizo GAM. The Yegua-Jackson Aquifer is the first area where interaction between groundwater and surface water is documented in detail. Mr. Afinowicz presented the compiled information for these systems similar in format to the previous presentations.

A briefing and discussion of the impacts of proposed desired future condition on subsidence, as required by Texas Water Code Chapter 36.108(d)(5) was next on the agenda. Mr. Afinowicz noted that this factor is a much more critical issue for this region than any other region in the State. Presented material focused on the studies and data directly from the subsidence districts and predicted outputs from the updated NGC GAM Run 2 for the areas outside of the subsidence districts. The subsidence package from the model gives a regional perspective on subsidence, but the localized studies are more beneficial and reliable to account for specific and localized occurrences and causes. The numbers represented were county averages from 2010 to 2070 assuming the pumpage in the NGC GAM Run 2. Potential subsidence is shown greatest around concentrated pumping centers and lower, distributed pumping shows the least or none at all.

Ms. Jones asked for a review of progress to date for GMA 14, remaining considerations, and future actions from Mr. Mullican. Remaining considerations are socio-economic impacts, impacts of proposed DFCs on private property rights, and feasibility of achievement of adopted DFCs. Mr. Mullican announced that he will send a prompt to the districts for discussion of how their rules and management plans work toward protecting private property rights in their districts. In addition, there is a catch-all for any other considerations not part of the specific criteria. Once these are completed, a draft of the desired future conditions will be presented. All of the criterion should be completed by the end of the year with finalization of the explanatory report to follow.

Discussion of funding levels, participation, and any other aspects of the Interlocal Agreement was led by Ms. Jones. The draft resolution distributed regarding the proposed administrative procedures for the consideration, proposal, and adoption of desired future conditions as proposed at the April 30, 2014 GMA 14 meeting was discussed, and Ms. Shauna Fitzsimmons, of Sledge Fancher, PLLC, was available for questions. As the statute is silent on the procedural process

regarding the formal or informal consideration of DFCs to the extent the DFC must be evaluated using the nine statutory factors and included in the explanatory report, establishing such procedures upfront will will be of benefit to the clarity and fluidity of the process as well as ensure the development of an effective administrative record through the production of the explanatory report. Ms. Jones noted there had been several questions, comments, and feedback received which would be considered and implemented into a revised document. Ms. Fitzsimmons said that the 'Whereas' clauses in the resolution reference relevant statutes in the Water Code and provide the background for the document, and the substantive material is the language in the procedures section. Mr. Martin gave insight into his issues with the draft document. Mr. Martin outlined the procedure for a GCD rulemaking and adoption procedure with notice and hearing and noted that Chapter 36 does not give reference to handling these administrative procedures in the manner proposed. He then asked if the proposed administrative procedures should be handled as a rulemaking, or could they be challenged if we proceed as written. Ms. Fitzsimmons explained the intent and purpose of this document as more 'bylaws' for the GMA rather than rules adopted by districts. Mr. Martin raised another question of wording identifying a specific consultant, and how it may need to be generic to be better utilized by the GMA. Ms. Fitzsimmons noted the benefit of having a consultant involved in the process from the onset. The definition includes any consultant that the GMA contracts with and also names the current consultant. Mr. Martin added another question regarding collection and distribution of information to be brought before the GMA instead of through the consultant. Ms. Fitzsimmons noted that the receipt of written requests by the consultant is to ensure all necessary information is collected for an educated decision to be made by the GMA, not by the consultant. The GMA is the only decision maker for DFC considerations. Any potential conflicts of interest regarding the consultant should have been a part of the initial request for proposal and contract discussions. Mr. Martin inquired if there could or should be a cutoff date for receipt of information related to DFCs. Mr. Mullican noted that after the proposed DFCs and the individual public hearings held by the districts, there is a vehicle and requirement to submit all information and requested changes to the proposed DFCs to the GMA. Any and all of the requested changes would then have to be considered related to the nine factors. Mr. Martin brought up the point that we have just considered a new model run, and questioned whether we need to go back and complete the factors which were discussed with the previous model run. Mr. Mullican agreed that at a future meeting it would be a good idea to have an agenda item to ratify the previously considered factors with the updated model run. Ms. Jones asked for guidance for the draft document. Some wished to further review the document and Ms. Jones requested all comments to be submitted by July 7, 2014. Ms. Jones recognized Mr. Brian Sledge of Sledge Fancher, PLLC to highlight actions of other districts and GMAs related establishing the administrative record and its importance to the explanatory report. Ms. Jones reviewed the financial outlook of the Participants moving forward.

There was no presentation of discussion by districts of recent activities of interest to or impacting the GMA 14 planning group.

The GMA 14 Joint Planning Committee Meeting was re-opened at 2:57 PM.

1900

The next meeting date was discussed and set for Tuesday September 23, 2014, at 1:30 PM at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303.

Without further discussion and there being no further business, the meeting was adjourned at 3:00 PM.

PASSED, APPROVED, AND ADOPTED THIS 23rd day of September, 2014

Joint Planning Group Meeting

Tuesday, September 23, 2014 1:30 PM

MEETING MINUTES

A regular meeting of GMA 14 was held Tuesday, September 23, 2014, at 1:30 PM, in the board room of the Lone Star Groundwater Conservation District located at 655 Conroe Park North Drive, Conroe, Texas.

The meeting was called to order by Kathy Turner Jones (Lone Star GCD) at 1:30 PM with a roll call of District representatives and Interlocal Agreement Participants. Districts represented included: Brazoria County GCD (joining at 2:15 PM), Bluebonnet GCD, Lone Star GCD, Lower Trinity GCD and Southeast Texas GCD. Interlocal Agreement Participants included: The Honorable John Brieden, Washington County Judge; and Mike Turco, Harris-Galveston Subsidence District & Fort Bend Subsidence District. Also in attendance at the meeting were: Texas Water Development Board Member Bech Bruun, Jason Afinowicz, Freese and Nichols, Inc.; Larry French, Texas Water Development Board (TWDB); Bill Mullican, Mullican and Associates; and members of the public. (see Attachment "A" for a list of attendees).

With no registered public comment, Ms. Jones proceeded with receipt and requests of posted notices from the group. Ms. Jones then asked for consideration of the approval of the minutes from the GMA 14 meeting on June 24, 2014. After discussion and upon a motion by Mr. Martin, seconded by Mr. Jacobs the minutes for the June 24, 2014 meeting were approved unanimously.

Meeting convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

The GMA 14 Joint Planning Interlocal Agreement Participants meeting was called to order at 1:42 PM

Ms. Jones began this portion of the meeting by continuing discussions of the nine factors set forth in Texas Water Code Section 36.108, Subsection (d), each of which must be considered by the member districts before voting on the proposed DFCs for the aquifers in GMA 14. In previous meetings, we considered factors (1) through (5) listed in the statute, including aquifer uses or conditions within the management area, water supply needs and management strategies provided in the state water plan, hydrological conditions such as the total estimated recoverable storage, average annual recharge, inflows, and discharge for each aquifer, other environmental impacts, and subsidence. Today we will consider factors (6) and (7) regarding socioeconomic impacts and impacts on property rights.

Ms. Jones called for the briefing and discussion of the socioeconomic impacts reasonably expected to occur as a result of the DFCs, as required by Texas Water Code Section 36.108(d)(6). Mr. Mullican had prepared a presentation brief to the group on this issue (see Attachment "B" for slides). After an in depth history of socioeconomic impact analysis and its origins in State water planning, Mr. Mullican read into the record from a qualitative perspective, both positive and negative socioeconomic impacts he found to potentially result from implementation of proposed DFCs:

 Proposed DFCs may require conversion to alternative supply, which may have increased costs associated to infrastructure, operation, and maintenance;

 Proposed DFCs may reduce/eliminate the costs of lowering pumps and either drilling or deepening wells;

 Proposed DFCs may reduce/eliminate the costs associated with subsidence (including legal costs assigned to parties determined to be liable);

 Proposed DFCs may serve to sustain/enhance economic growth due to assurances provided y diversified water portfolio;

 Alternatives to proposed DFCs may result in short-term reduction in utility rates due to reduction in cost of water management strategy implementation; and

 Alternatives to proposed DFCs may result in significant but unquantified production costs due to transition from confined to unconfined conditions in local aquifers.

Mr. Mullican then requested each GMA Representative and Interlocal Participant to answer to and speak on these considerations in relation to their individual representative area.

Mr. Turco began the discussion reflecting on how this list affects the subsidence districts with subsidence being a big issue for the area. For the purpose of this consideration, the qualitative approach is beneficial. There are lots of costs associated with conversion from source to source that are certainly socioeconomic impacts from their regulatory plan perspective and the DFCs proposed by this group. Mr. Turco did suggest the addition of potential economic impact from base flow loss to estuaries, which needs more thought. Overall, it is a complete list surmising the impact from a well-rounded view.

Mr. Holland agreed with the overall general qualitative approach being applicable not only from an individual district perspective, but for the area at large. The specific item which stood out in his mind was the proposed DFCs reduction or elimination of costs to lower pumps and either drilling or deepening wells. With older wells, 40 plus years old, completed much shallower, generally less than 150 feet total depth, these wells need to be deepened into more saturated sands for quality and sustainability of the well regardless of the DFC to protect from the shallow fluctuations over time, placing these wells in a more confined than unconfined system. Though there will certainly be varied socioeconomic impacts across the area from a reduction or elimination of these costs, there may be some inherent increases as the standards and depths of new or replacement wells have changed over time.

Ms. Jones gave a statement into the record for use and documentation into the explanatory report regarding Lone Star GCD's approach and consideration of socioeconomic impacts reasonably expected to occur (see Attachment "C" for Lone Star GCD).

Mr. Burkett noted that he had nothing to add after the formed statements from Ms. Jones.

Mr. Jacobs commented on surface water available from the City of Houston in Lake Livingston. The costs of running that water to other systems which have been solely dependent on groundwater are of interest. Some entities looking to replacement wells and/or new wells are more strategically placing them to easily provide for and add to existing infrastructure, greatly reflecting costs and impacts.

Mr. Martin noted that his district is the location of the two largest reservoirs in the state and has only one significant surface water user located within his district. He also contrasted the large expected growth of Ms. Jones district (Montgomery County) to his district, with Southeast Texas GCD not witnessing or expecting significant growth at all. Their DFCs are actually factored to encourage growth and bring economic resources to the area. Mr. Martin also echoed Mr. Holland's statement regarding the older, shallower wells in his district.

Judge Brieden was alarmed that Region G showed no water needs for Washington County. The whole reason why he is at the table is to ensure that the County's needs are met throughout planning and to be proactive process. Surface water is a primary driver for the County as their large population center has transitioned to surface water over groundwater. The 2011 drought did challenge their county, especially as weekend or seasonal properties have taken off in the rural areas with the felt need for ponds filled from groundwater wells, causing well issues. The DFCs are important to us for our current and future needs with projected growth to support.

Ms. Jones brought up a point of quality issues which did not seem to be addresses specifically by any of the considerations with increased costs of treatment from quality declines. With no further discussion, Mr. Mullican reiterated that this is not the only or last opportunity to amend this list and items discussed related to socioeconomic impacts reasonably expected to occur.

Ms. Jones moved to the next topic of a briefing and discussion of the impacts on the interests and rights in private property in considering DFCs by the districts, as required by Texas Water Code Section 36.108(d)(7). Mr. Mullican again was given the floor to present and outline the framework and guidance of the interests and rights in private property, including ownership and the rights of management area landowners and their lessees and assigns in groundwater, as recognized under Texas Water Code Section 36.002, specifically what the section does and does not do (see Attachment "B" for slides). The procedural requirements for what should be considered in reviewing the private property rights factor are not prescribed in statute nor do TWDB rules provide any additional guidance. As such, Mr. Mullican established the following list of topics suggested for discussion:

- Existing uses within the GCD;
- Projected future uses within the GCD;
- Investment-backed expectations of existing users and property owners within the GCD;
- Long-term viability of groundwater resources in area;
- Availability of water to all properties and ability to allocate MAG through rules after DFC adoption;

- Whether immediate cutbacks would be required in setting a particular DFC or whether cutbacks, if any, would need to occur over certain timeframe;
- For outcrop areas, how the outcrop depletes rapidly in dry times, and whether drought rules or triggers based on the DFC/MAG for the outcrop could be beneficial to ensure viability of the resource during dry times;
- Economic consequences to existing users (i.e. cost to drop pumps, reconfigure or drill new wells upon water table dropping, etc.). Also consider the reverse economic consequences of less water available to protect the existing users from the economic consequences relevant to existing users reaching a balance between these two dynamics:
- Those GCDs with existing rules developed based on the current DFC might find it helpful to review the rules that the GCD considers relevant as we work to adopt DFCs over the next year. For example, the rules and Management Plan in place based on the current DFCs can help determine how a GCD currently impacts private property rights and whether those same interests are important as we work to adopt DFCs over the next two years; and
- Focusing on finding a balance, as that balance is defined by each GCD, between all of these considerations.

Mr. Mullican again directed each GMA Representative and Interlocal Participant to answer to and speak on these considerations in relation to their individual representative area.

Judge Brieden gave thoughts on balance between the ownership and competing pressure of use across property bounds when using the same resource. How one can negatively affect your neighbor and minimize development is a dynamic that must be considered for the future. How all of these things fit together impact the growth and availability of supply to ultimately drive decision making.

Mr. Martin highlighted a couple of ways that his district protects private property rights. One being that his district's enabling legislation specifically states that a permit cannot be required for any well capable of less than 25,000 gallons per day. Secondly, is his district's goal to meet the Chapter 36 requirement of "highest practicable use" balanced with the other required factors and as evidenced by the current GMA 14 GAM Run.

Mr. Jacobs added a couple of his district approaches being through drought contingency plans for all users. In addition, any changes in the district's rules are also reflective of considerations of private property rights.

Ms. Jones read a statement into the record for use and documentation into the explanatory report regarding Lone Star GCD's approach and considerations on impacts on the interests and rights in private property (see Attachment "D" for Lone Star GCD).

Mr. Holland highlighted the placement of the ownership in Chapter 36. Chapter 36 is the backbone and the skeleton of GCD creation and fleshed out through enabling legislation, district rules, and Management Plan, giving a fundamental principal to GCDs to not only recognize but protect these rights. The DFCs are what is perceived today that the aquifer will tolerate from an

impact standpoint that will not damage the aquifer as a whole. What we know and have available today will fail in comparison with what we will know tomorrow. The important thing to remember with the DFCs, rules, management plans, and so on, is that they are able, and going, to change to reflect advances in science. Private property rights should be at the forefront, but also continued advances in the science, to conserve, preserve, and protect the resources.

Mr. Turco expanded on the primary purpose of the subsidence districts is to protect property from subsidence and do so through the regulation of groundwater. With the advancement of sciences over the years, the subsidence districts update regulatory plans to provide the most viable use of resources while stopping the subsidence throughout the region. These planning areas are at different conversion rates across the district, some down to 10% groundwater use, which has reflected in subsidence reductions. Still allow property owners to withdraw water, just have to meet the regulatory requirements in place through a fair share approach rather than a specific amount. We will continue to collect data to advance science, ensure our regulatory plan is reasonable, alternative sources are available, so that property owners can get the water they need and ensure the mix between groundwater and alternative water are sufficient to address subsidence in the local area.

Mr. Burkett read a prepared statement into the record for use and documentation into the explanatory report Brazoria County GCD's approach and considerations on impacts on the interests and rights in private property (see Attachment "E" for prepared statement).

With no additional thoughts, Mr. Mullican again reiterated that this is not the only or last opportunity to amend this list and items related to the consideration of the impact on the interests and rights in private property. Mr. Mullican requested each District Representative and Interlocal Participant to memorialize their comments and submit them for direct use in the explanatory report.

At the close of this discussion, Ms. Jones directed attention to a standing agenda item to discuss funding levels, participation, and any other aspects of the Interlocal Agreement. Mr. Burkett asked for clarification that an estimated \$5000.00 deficit remained in covering the contracts, referencing the financials which were provided. Ms. Jones confirmed the remaining deficit which would be addressed in a future meeting. There was no discussion or action taken.

The floor was opened for presentation and discussion by Members and participants of recent activities of interest to or impacting the GMA 14 planning group. Mr. Turco opened with a summation of activities wrapping up before the subsidence districts. Mr. Holland noted the district rules revisions to be considered in October by the district. Mr. Jacobs updated on the Lower Trinity GCD's Management Plan adoption process. Mr. Martin announced congratulations and bittersweet sentiments of the retirement of Mr. Jacobs at the end of the year. The group shared their well wishes, support, and appreciation for Mr. Jacobs and his district moving forward. Ms. Jones called attention to the revised draft Resolution Establishing Procedures for the Consideration, Proposal, and Adoption of DFCs by GMA 14. At our meeting in June, Shauna Fitzsimmons, with Sledge Fancher, reviewed the procedures set forth in the Resolution and answered various questions regarding the Resolution and the procedures

provided in it, and at that meeting, we decided to allow for an additional period of time to enable District Members the opportunity to submit comments or proposed revisions to the Resolution. All comments were submitted to Ms. Jones, which were then forwarded to Ms. Fitzsimmons. Comments were received from Southeast Texas GCD and Bluebonnet GCD, and each comment has been specifically addressed.

As Ms. Fitzsimmons has reiterated, the purpose of adopting these procedures is to clearly define the process by which the GMA shall consider, propose, and adopt DFCs, as such procedure is unclear under the statute. Additionally, the adoption of these procedures will ensure that the Member Districts comply with the statutory requirements applicable to the establishment of DFCs and that the explanatory report includes all the necessary information to create an administrative record that is defensible in the event the DFC are appealed after adoption. Ms. Jones asked Ms. Fitzsimmons to take the floor to review the changes to the draft resolution and answer any questions.

Ms. Fitzsimmons summarized the draft, its purpose, and the changes incorporated from the previous draft discussed at the previous meeting. With the importance of the explanatory report, it is equally important to create a defensible report in the formal consideration of DFCs and the procedures which those formal considerations will be based.

Ms. Jones advised everyone to read these procedures thoroughly as action will be taken at our next meeting to approve the resolution establishing the procedures. Ms. Jones requested all to please send any final comments regarding the procedures no later than October 17th.

Ms. Jones recognized TWDB Member Bruun for Board announcements or comments. Board Member Bruun voiced his appreciation of being at the meeting and expanded on a point from Mr. Mullican's presentation. The new Board is looking to be more involved in all areas of water, not only because of personal interest but the intent and directive of the Legislature in restructuring TWDB. Anything that you encounter from a GMA to your individual business, we have an open door policy and look forward to working with you.

Mr. French gave a quick agency update on GMA related work. First was Mr. Jacob's referenced Management Plan being reviewed and should be completed in the near future. He also extended his congratulations Mr. Jacobs again on his retirement. Second was a formal request from GMA 14 to give additional explanation and background to the total estimated recoverable storage number which the Executive Administrator responded to and Ms. Jones forwarded the response to the members.

With no further discussion in terms of recent activities or interest to the GMA planning group Ms. Jones asked for a motion to adjourn the meeting of the GMA 14 Interlocal Agreement participants and reconvene the Joint Planning Group meeting. Such motion was made by Mr. Burkett and seconded by Mr. Martin, adjourning the meeting of the GMA 14 Interlocal Agreement Participants and reconvening the Joint Planning Group meeting at 3:36 PM

Ms. Jones directed discussion of the progress to date for GMA 14 Joint Planning and remaining requirements. Mr. Mullican was given the floor and stated that the GMA will not make the deadline to include this round of DFCs into the current Regional Water Plan. He continued to summarize progress and highlight next meeting agenda discussion and action items of Texas Water Code Section 36.108(d)(8) regarding the feasibility of achieving proposed DFCs, Texas Water Code Section 36.108(d)(9) regarding other factors deemed for consideration by the GMA, and review and consideration of "non-relevant" aquifers documentation.

The next meeting date was discussed and set for Tuesday November 18, 2014, at 1:30 PM at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303.

Without further discussion and there being no further business, following a motion by Mr. Martin and seconded by Mr. Burkett, the meeting was adjourned at 3:43 PM.

PASSED, APPROVED, AND ADOPTED THIS 18 day of NOUTWICE, 2014

Chairman

ATTEST:

Groundwater Management Area 14 Meeting

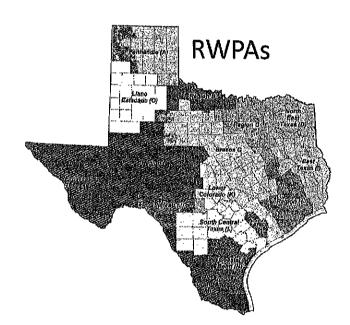

Lone Star Groundwater Conservation District Offices

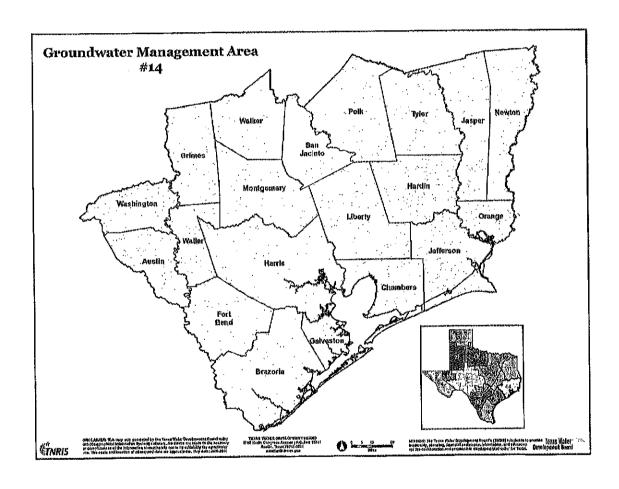

Conroe, Texas September 23, 2014

Today's Considerations

- TWC Section 36.108 (d) (6) socioeconomic impacts reasonably expected to occur
- TWC Section 36.108 (d) (7) impact on the interests and rights in private property

Socioeconomic Impacts and Water Planning in Texas – A Brief History

- Texas Water Code Chapter 16.051 (a) the board shall prepare, develop, formulate, and adopt a comprehensive state water plan that . . . shall provide for . . . further economic development (companion provision in TWC Chapter 16.053 (a, b) for regional water plans).
- Texas Administrative Code (TAC), Title 31, Chapter 357.7 (4)(A) states, "The executive administrator shall provide available technical assistance to the regional water planning groups, upon request, on water supply and demand analysis, including methods to evaluate the social and economic impacts of not meeting needs."

Socioeconomic Impacts and Water Planning in Texas – A Brief History (cont.)

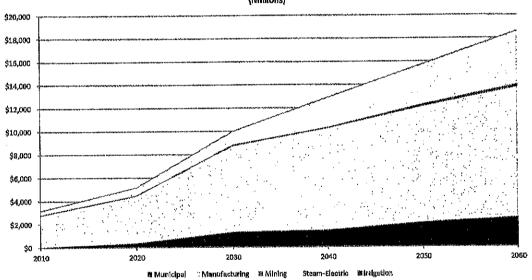

• TAC, Title 31, Chapter 357.40 (a) RWPs shall include a quantitative description of the socioeconomic impacts of not meeting the identified water needs pursuant to §357.33(c) of this title (relating to Needs Analysis: Comparison of Water Supplies and Demands).

Socioeconomic Impacts Analysis

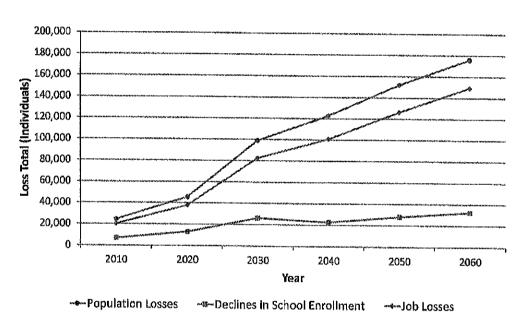

- Executed by TWDB at request of RWPGs
- Uses water supply needs from Regional Water Plan
- Point estimates of 1-year drought at 10-year intervals
- Analysis attempts to measure the impacts in the event that water user groups do not meet their identified water supply needs associated with a drought of record for one year.
- Multiple impacts examined
 - Sales, income, and tax revenue
 - Jobs
 - Population
 - School enrollment
- Results incorporated into final Regional Water Plan

Socioeconomic Impacts Analysis – 2011 Region H Water Plan

Socioeconomic Impact Analysis – 2011 Region H Water Plan

Socioeconomic impact of not meeting water supply needs vs. impact of proposed desired future conditions

- Regional Water Planning (from TWDB)
 - Generate Input-Output Models combined with Social Accounting Models (IO/SAM) and develop economic baselines. Utilizes IMPLAN (Impact for Planning Analysis) software.
 - Economic baseline developed for counties, planning regions, and the state based on variables for 528 economic sectors as follows:

Socioeconomic impact of not meeting water supply needs vs. impact of proposed desired future conditions

- output total production of goods and services measured by gross sales revenues
- final sales sales to end user in Texas (a region) and exports out of region
- Employment number of full and part-time jobs required by a given industry
- Regional income total payroll costs paid by industries, corporate income, rental income, and interest payments
- Business taxes sales, excise, fees, licenses and other taxes paid during normal operation

Socioeconomic impact of not meeting water supply needs vs. impact of proposed desired future conditions

- Regional Water Planning (from TWDB cont.)
 - Estimate direct and indirect impacts to business, industry, and agriculture
 - Impact associated with domestic water usage
- While useful for planning purposes, socioeconomic impacts developed for regional water planning do not represent a benefit-cost analysis.
- Analysis only executed for water user groups with needs for additional water supply.

Impacts by county are not presented in the 2011 East Texas Regional Water Plan. For full analysis, see TWDB correspondence to Kelley Holcomb from Stuart Norvell dated June 1, 2010, titled "Socioeconomic impact analysis of not meeting water needs for the 2011 East Texas Regional Water Plan."

During the first round of joint-planning (2005 – 2010), the TWDB adopted rules to describe what is to be considered in the petition process. With the passage of Senate Bill 660, these <u>rules were repealed</u>.

TAC § 356.45. Board Evaluation, Consideration, and Deliberation

(a) The executive administrator shall prepare a list of findings based on evidence received at the hearing and may also provide a summary, analysis, and recommendations relating to revisions to districts' plans and desired future conditions to the board.

Potential socioeconomic impact of proposed DFCs (cont. – note, these rules repealed with passage of SB 660 in 2011)

TAC § 356.45. Board Evaluation, Consideration, and Deliberation (cont.)

- (b) The executive administrator or the board may, at any stage of the process described in this subchapter, terminate the proceedings on a petition when an agreement is reached resolving the petition or a petition has been withdrawn. Any such agreements shall become a part of the record.
- (c) The board shall base any recommended revisions to a plan and to the desired future conditions only on evidence in the hearing record. The board shall consider the following criteria when determining whether a desired future condition is reasonable:

Potential socioeconomic impact of proposed DFCs (cont. – note, these rules repealed with passage of SB 660 in 2011)

(1) the adopted desired future conditions are physically possible and the consideration given groundwater use;

(2) the socio-economic impacts reasonably expected to occur;

- (3) the environmental impacts including, but not limited to, impacts to spring flow or other interaction between groundwater and surface water;
- (4) the state's policy and legislative directives;
- (5) the impact on private property rights;
- (6) the reasonable and prudent development of the state's groundwater resources; and
- (7) any other information relevant to the specific desired future condition.

Petitions from the first round and socioeconomic impacts considered

- GMA 1
 - TWDB report dated February 10, 2010
- GMA 12
 - TWDB report dated June 13, 2012

- TWC Chapter 36.108 (d) and (d) (6) states, "the districts shall consider groundwater availability models and other data or information for the management area and shall propose for adoption desired future conditions for the relevant aquifers within the management area. Before voting on the proposed desired future conditions of the aquifers . . . the districts shall consider socioeconomic impacts reasonably expected to occur;"
- Proposed DFCs are quantitative descriptions at specific points in time (decadal) of groundwater resources in a management area.
- This requirement was added to the requirements of joint planning with the passage of Senate Bill 660 in 2011.

- From a qualitative perspective, both positive and negative socioeconomic impacts may potentially result from implementation of proposed DFCs.
 - Proposed DFCs may require conversion to alternative supply, which may have increased costs associated to infrastructure, operation, and maintenance.
 - Proposed DFCs may reduce/eliminate the costs of lowering pumps and either drilling or deepening of wells.
 - Proposed DFCs may reduce/eliminate the costs associated with subsidence (including legal costs assigned to parties determined to be liable).

- Positive and negative socioeconomic impacts potentially resulting from implementation of proposed DFCs:
 - Proposed DFCs may serve to sustain/enhance economic growth due to assurances provided by diversified water portfolio.
 - Alternatives to proposed DFCs may result in short-term reduction in utility rates due to reduction in cost of water management strategy implementation.
 - Alternatives to proposed DFCs may result in significant but unquantified production costs due to transition from confined to unconfined conditions in local aquifers.

Today's Considerations

- TWC Section 36.108 (d) (6) socioeconomic impacts reasonably expected to occur
- TWC Section 36.108 (d) (7) impact on the interests and rights in private property

Texas Water Code Section 36.108 (d) (7)

Consideration of the impact on the interests and rights in private property, including ownership and the rights of management area landowners and their lessees and assigns in groundwater, as recognized under Texas Water Code Section 36.002.

Texas Water Code Section 36.108 (d) (7)

For reference, Texas Water Code Section 36.002 states:

- (a) The legislature recognizes that a landowner owns the groundwater below the surface of the landowner's land as real property.
- (b) The groundwater ownership and rights described by this section:
- (1) entitle the landowner, including a landowner's lessees, heirs, or assigns, to drill for and produce the groundwater below the surface of real property, subject to Subsection (d), without causing waste or malicious drainage of other property or negligently causing subsidence, but does not entitle a landowner, including a landowner's lessees, heirs, or assigns, to the right to capture a specific amount of groundwater below the surface of that landowner's land; and

Texas Water Code Section 36.108 (d) (7)

For your reference, Texas Water Code Section 36.002 states (cont.):

- (2) do not affect the existence of common law defenses or other defenses to liability under the rule of capture.
- (c) Nothing in this code shall be construed as granting the authority to deprive or divest a landowner, including a landowner's lessees, heirs, or assigns, of the groundwater ownership and rights described by this section.

Texas Water Code 36.002

- (d) This section does not:
- (1) prohibit a district from limiting or prohibiting the drilling of a well by a landowner for failure or inability to comply with minimum well spacing or tract size requirements adopted by the district;
- (2) affect the ability of a district to regulate groundwater production as authorized under Section 36.113, 36.116, or 36.122 or otherwise under this chapter or a special law governing a district; or
- (3) require that a rule adopted by a district allocate to each landowner a proportionate share of available groundwater for production from the aquifer based on the number of acres owned by the landowner.

Texas Water Code 36.002

- (e) This section does not affect the ability to regulate groundwater in any manner authorized under:
- (1) Chapter 626, Acts of the 73rd Legislature, Regular Session, 1993, for the Edwards Aquifer Authority;
- (2) Chapter 8801, Special District Local Laws Code, for the Harris-Galveston Subsidence District; and
- (3) Chapter 8834, Special District Local Laws Code, for the Fort Bend Subsidence District.

The protection of private property rights by GCDs in GMA 14

The procedural requirements for what should be considered in reviewing the private property rights factor are not prescribed in statute nor do TWDB rules provide any additional guidance. The following list of topics are suggested for discussion:

- Existing uses within the GCD
- Projected future uses within the GCD
- Investment-backed expectations of existing users and property owners within the GCD

The protection of private property rights by GCDs in GMA 14 (Continued)

- Long-term viability of groundwater resources in area
- Availability of water to all properties and ability to allocate
 MAG through rules after DFC adoption
- Whether immediate cutbacks would be required in setting a particular DFC or whether cutbacks, if any, would need to occur over a certain timeframe

The protection of private property rights by GCDs in GMA 14 (Continued)

- For outcrop areas, how the outcrop depletes rapidly in dry times, and whether drought rules or triggers based on the DFC/MAG for the outcrop could be beneficial to ensure viability of the resource during dry times
- Economic consequences to existing users (i.e., cost to drop pumps, reconfigure or drill new wells upon water table dropping, etc.). Also consider the reverse—economic consequences of less water available to protect the existing users from the economic consequences relevant to existing users—reaching a balance between these two dynamics.

The protection of private property rights by GCDs in GMA 14 (Continued)

- Those GCDs with existing rules developed based on the current DFC might find it helpful to review the rules that the GCD considers relevant as we work to adopt DFCs over the next year. For example, the rules and Management Plan in place based on the current DFCs can help determine how a GCD currently impacts private property rights and whether those same interests are important as we work to adopt DFCs over the next 2 years.
- Focusing on finding a balance, as that balance is defined by each GCD, between all of these considerations

Next meeting

- TWC 36.108 (d) (8) feasibility of achieving proposed desired future condition.
- TWC 36.108 (d) (9) other factors
- Review and consideration of "non-relevant" aquifer documentation

Attachment "C"

GMA 14 Establishment of Desired Future Conditions ("DFCs") Socioeconomic Impacts in the Lone Star Groundwater Conservation District

In considering the socioeconomic impacts reasonably expected to occur as a result of the DFCs, it is necessary to address the fact that the proposed DFCs may require conversion to alternative water supplies, which may have increased costs associated with infrastructure, operation, and maintenance. This impact is primarily significant for the Lone Star Groundwater Conservation District ("Lone Star" or the "District") because the District has already adopted a District Regulatory Plan that anticipates both conservation and the future partial conversion to alternative water supplies to ensure the long-term sustainability of the groundwater resources in the Gulf Coast Aquifer.

The cost of producing groundwater when groundwater levels were near the land surface historically was the cheapest source of water available to Montgomery County residents. But, Montgomery County has relied almost exclusively on Gulf Coast Aquifer groundwater for its entire history, and water levels in the aquifers have dropped substantially because of the continued population and economic growth in the county. The population of Montgomery County in 1960 was around 26,000, doubled to 50,000 by 1970, more than doubled again to 128,000 by 1980, and is approximately half a million today. Virtually all of that growth has occurred using solely Gulf Coast Aquifer groundwater resources. And we have seen drops in water levels in the aquifer of 200 to 300 feet in that time, and 300 to 400 foot declines in some areas from predevelopment conditions. And, moreover, in just 35 years from now, we are expected to have over one million people in the county.

Additionally, there are socioeconomic impacts to increased water level declines. The more levels decline, the greater the cost to produce groundwater. These costs can include energy costs to lift the groundwater to the land surface, and the cost of deepening pumps and wells to maintain well yields, or having to drill new wells. There are also the costs of land subsidence, which can result in increased flooding related to changed drainage patterns and ponding of water in big rain events. And, of course, the biggest cost associated with continued depletion of aquifer levels is if you get to the point where the primary water source for the county becomes no longer economically viable because the economic costs of the number of wells you have to drill and the operational costs of producing the water get to a point where they are no longer affordable, and the impacts that could have to economic growth in the county.

So, Lone Star's Board of Directors has tried to stay ahead of the curve in light or the District's tremendous historical and projected economic and population growth, and we know that continued economic growth depends upon having a reliable and affordable long-term water supply to support it. For that reason, Lone Star's Board of Directors has taken an approach towards making the Gulf Coast Aquifer resources in the county sustainable and reliable over the long-term. And, that sustainable approach is reflected in these DFCs.

So, the primary way that the DFCs for Montgomery County contribute in a positive way under a socioeconomic analysis is that the District is supporting economic growth and protecting the investment backed expectations of historical users, and ensuring groundwater is available

under all properties to new users, by managing the aquifer on a long-term sustainable basis and reducing or eliminating water level declines and the economic consequences of those declines.

On the other hand, managing the aquifer in this sustainable manner in light of the District's growth projections means that water users will continue to have to develop alternative water supply strategies, including surface water resources, Catahoula Aquifer resources, water reuse projects, desalination projects, and others. And there are obviously socioeconomic impacts associated with the development of those alternative water supplies, which is a reality for us and a huge concern for many in the District. But there is also a near-term and long-term socioeconomic benefit to the citizens of Montgomery County and its economy of now having this diversified water supply portfolio in the county, where there has historically been only a single source of supply.

Lone Star spent a great deal of time and effort in the last decade working on studies identifying available alternative water sources and the costs associated with them, and the District will continue to do so in the future. Lone Star has structured its regulatory plan and rules to achieve these DFCs in a way that reduces the cost of developing alternative water supplies to the extent possible. For example, the District's regulations are structured so that all of the available surface water resources in Lake Conroe can be used in the most affordable manner possible—by taking surface water the shortest distance possible from the lake into the high density areas where it can be used, and allowing continued use of groundwater by users located far away from the lake so that new infrastructure costs can be minimized. Also, because new supplies and new operational facilities, such as water treatment facilities, are implemented in large conversions rather than incrementally, the District's rules allow groundwater production averaging over the planning period to achieve the DFCs so that growth can continue to occur on groundwater until a new alternative water supply facility is brought on-line, and then overconvert, then grow on groundwater again until it is time for another facility. The DFCs and regulations are also structured to give water users plenty of lead time to secure those supplies and minimize disruption to their activities, with a full decade of advanced notice of the District's groundwater reductions and requirements for users to develop groundwater reduction plans and demonstrate incremental progress towards achieving them in order to minimize and economic disruption when the initial conversion occurs in 2016. The DFCs reflect that, in allowing the continued growth on groundwater until 2016 and the groundwater reductions after that date.

For these reasons, it seems necessary, at least for Lone Star, to give more weight and consideration to the socioeconomic impacts associated with both the conversion to alternative water supplies and with the benefits of the District's DFCs and regulatory plan on eliminating water level declines in the Gulf Coast Aquifer and providing users with a long-term sustainable and reliable supply of groundwater from the Gulf Coast Aquifer, and from the new diversified water supply portfolio that has developed in Montgomery County. Given all of these considerations, the District believes that the socioeconomic benefits of these DFCs and the regulatory plan used to achieve them outweigh the costs.

And, as the District better understands how the aquifer and its water levels respond after the District's first conversion effort in 2016, the District will continue to evaluate ways to make sure we are getting the most out of the groundwater resources in Montgomery County for near-

erm and long-term needs an ensure that.	d continue to adjust the District's I	OFCs and regulatory strategy to
•		
Lone Star GCD 9/23/14	Page 3	Socioeconomic Impacts

Attachment "D"

GMA 14 Establishment of Desired Future Conditions ("DFCs") Effects on Property Rights in the Lone Star Groundwater Conservation District

Since its creation in 2001, the Lone Star Groundwater Conservation District ("Lone Star" or the "District") has carefully considered and respected the property rights of all Montgomery County landowners when creating any rule or regulation. Because the District, its Management Plan and groundwater availability numbers, and its Rules pre-dated the creation of the DFCs concept by the legislature in 2005, the District had already determined a path for groundwater management and protection of groundwater resources prior to the first establishment of DFCs by GMA 14. The Lone Star board of directors' policy goal for groundwater management in Montgomery County was clearly established in its first management plan and in its first rules—to ensure the long-term viability of our aquifers and the long-term ability of landowners to sustainably produce groundwater in order to protect private property rights in the county and ensure continued economic growth from sustainable and reliable water supplies. That concept, sustainable long-term groundwater management, is reflected in both the current DFCs and the DFCs that are being considered for adoption for Montgomery County and the Lone Star Groundwater Conservation District.

Soon after its creation, the District conducted a series of studies that confirmed that groundwater was being pumped from the Gulf Coast Aquifer at a rate that significantly exceeded its recharge. Pumping had already begun to cause problems for many property owners in the county, with declining water levels, decreased well yields, and problems related to needing to lower pumps or drill new wells. The District's technical consultants estimated an overall effective recharge rate to the Gulf Coast Aquifer for withdrawal in Montgomery County of 64,000 acre feet per year. Pumping amounts already exceeded that recharge rate, and were impacting the groundwater levels in water wells in much of the county.

The Lone Star Board of Directors embarked upon a strategy of reducing groundwater production across the county to sustainable levels, and to identify alternative water sources, to ensure long-term viability of groundwater resources and a diversified water supply. That strategy is reflected in the District Rules, the District Management Plan, the District Regulatory Plan, and the DFCs being considered for Montgomery County.

That strategy is spelled out in great detail in Phase II(B) of the District Regulatory Plan and in the District Management Plan. But, simply stated, it strikes a careful balance of protecting the property rights of historical users to realize their investment-backed expectations while allowing all property owners in the county an opportunity to drill for and produce groundwater; it requires Large Volume Groundwater Users to reduce their production to 70 percent of 2009 levels by the year 2016 so that overall groundwater pumping from the Gulf Coast Aquifer will be reduced to long-term sustainable levels for the benefit of all property owners. The District adopted the first phase of its Regulatory Plan in 2006, giving large water users a 10-year lead time to identify and secure alternative water sources or conservation strategies before the 30 percent reduction went into effect. Subsequent phases of the Regulatory Plan made sure that those large users were making incremental progress towards achieving the

Attachment "D"

reductions, by requiring the preparation and submission of Water Resources Assessment Plans and Groundwater Reduction Plans.

The result of these strategic efforts by the Lone Star Groundwater Conservation District is that all large users currently have an approved Groundwater Reduction Plan of their choosing, which contains strategies to achieve the necessary groundwater pumping reductions in the Gulf Coast Aquifer to ensure its long-term viability for all property owners in the county. As stated earlier, another effect of the District's strategic plan is that the County's water supplies have diversified from almost 100 percent reliance on the Gulf Coast Aquifer to multiple water supply strategies including surface water, reuse, groundwater production from the Catahoula Aquifer, and others, which benefits all property owners and their rights.

The District's groundwater management strategy is an adaptive one. Once the District is able to evaluate the effects of the 2016 groundwater reduction on the various layers of the Gulf Coast Aquifer, it will be able to determine whether additional groundwater resources may be developed in the future in all or some parts of the county and to what extent. Clearly, owners of existing water wells will expect continued availability of water. Existing property owners in the county will expect to be able to use their property in a manner that meets their investment-backed expectations, regardless of whether they have their own water wells or rely on a water supplier to provide water to their properties. New property owners will have similar expectations.

The District's DFCs and the regulations designed to achieve them are designed to ensure that these expectations are met and are designed to strike that balance for property owners—reducing groundwater pumpage to an amount that will stabilize water levels for long-term economically viable pumping, protection of investments, and allowing access by new users. The District faces huge increases in population and economic growth, and knows that that will add significant demands on the water resources in the county. The District is committed to staying ahead of the curve to ensure that reliable and affordable water supplies are available throughout the county. These DFCs and the District's regulations will ensure that property owners can expect to continue to enjoy adequate water supplies, that the economic growth of Montgomery County will continue to be strong, and that the negative impacts of excessive withdrawals such as land subsidence, increased pumpage costs, and lowering water table levels and the impacts of those on property owners will be minimized.

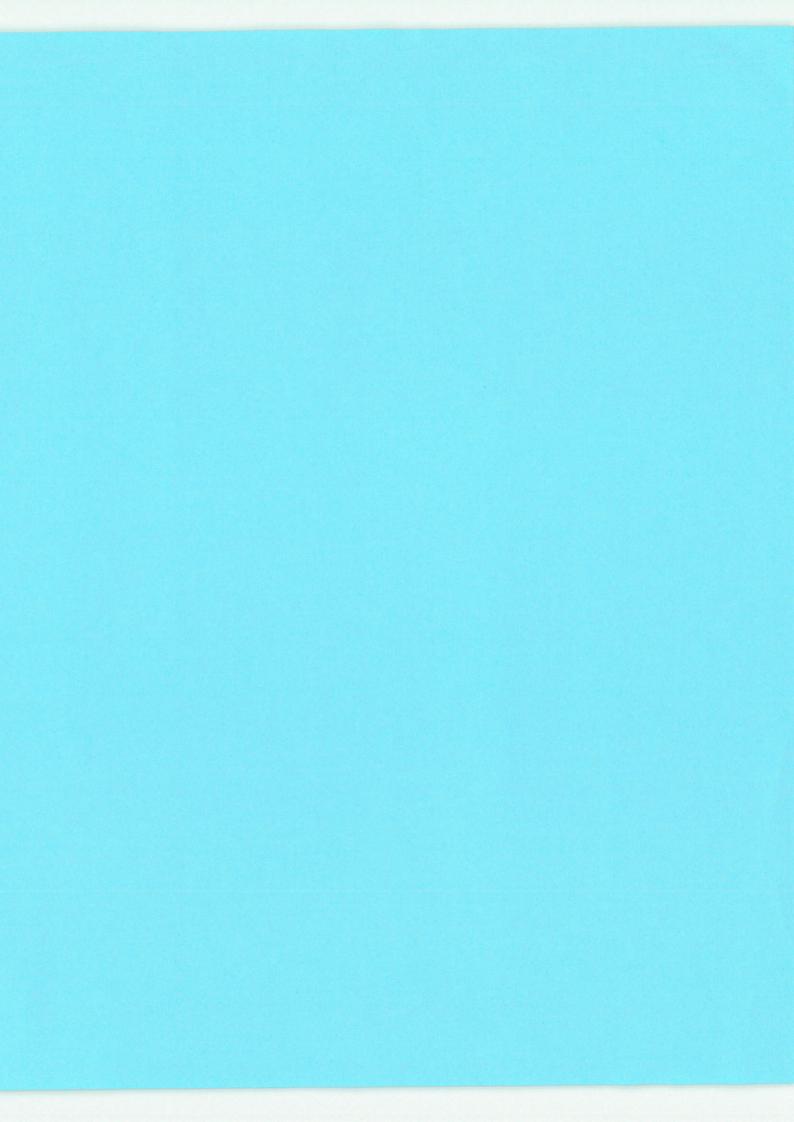

Attachment "E"

- Existing uses within the GCD
 - Water usage is Brazoria County has varied over the past 30 years. Some of this variation has caused a reduction in demand due to shifts in irrigated agriculture and particularly rice production. In contract municipal demands have grown substantially over this time and represent the largest demand in the county. Usage estimates for the period from 2006-2010, as presented in the District's 2012 Regulatory Plan, average 45,723 acre-feet per year and peak at 52,145 acre-feet per year. Although the observed average pumpage is below the long-term average pumpage level considered in the draft DFC simulation (50,400 acre-feet per year) the peak pumpage identified exceeds this threshold.
- Projected future uses within the GCD
 - Overall water demand is expected to grow in Brazoria County over the next 50 years. In particular, the municipal sector which has the greatest reliance on groundwater, is expected to grow by 66.6 percent by 2060. Irrigation use is expected to be level over this time, but recent droughts and scarcity of water may encourage more use of groundwater in providing for irrigated agriculture in the future.
- Investment-backed expectations of existing users and property owners within the GCD
 - o There are significant investments in industrial and agricultural facilities, businesses, homes, and infrastructure that may be impacted by land subsidence caused by over production of groundwater. Regulations to prevent overproduction of groundwater will prevent subsidence and protect those investments. Recent discussion involving water supply in Brazoria County facilitated through Region H, The Water For Our Future Task Force, and, most recently, the regional facility study conducted by the Brazosport Water Authority (BWA) have brought attention to the somewhat narrow margins of water supply available from the Gulf Coast Aquifer and have encouraged exploration of alternative supplies in light of this limitation. Development of future groundwater-based supplies is being conducted with open dialogue between the water supply and regulatory communities regarding the potential implications of groundwater reduction should such measures become necessary in the future.
- Long-term viability of groundwater resources in area
 - The District is engaged in a long-term process to assess, based on the best available science, the availability of groundwater that may be developed in a responsible manner in Brazoria County. Current demand projections and estimates of availability suggest a need for regulation of pumpage to acceptable limits at some point in the future to achieve the proposed DFC, but the District has not yet reached a decision on how this is to be accomplished.
- Availability of water to all properties and ability to allocate MAG through rules after DFC adoption
 - The District currently issues permits based on reasonable demand for a beneficial use without waste. Every property owner in the District may produce groundwater either through a permit or for an exempt use as long as the groundwater is put to a beneficial use without waste. Aggregate groundwater production levels do not currently exceed the MAG, but future demand will certainly exceed those levels

Attachment "E"

in the near future. The District Board will establish appropriate policies to ensure aggregate production will be limited to a level that will ensure achieving the DFC.

- Whether immediate cutbacks would be required in setting a particular DFC or whether cutbacks, if any, would need to occur over a certain timeframe
 - O Although the District foresees the potential need for production limitations or reductions to be put in place, it is not prepared to do so at this time without further study into the current level of water use and the impacts of groundwater pumpage on the Gulf Coast Aquifer within Brazoria County.
- For outcrop areas, how the outcrop depletes rapidly in dry times, and whether drought rules or triggers based on the DFC/MAG for the outcrop could be beneficial to ensure viability of the resource during dry times
 - The Gulf Coast Aquifer outcrops in Brazoria County by way of surface interactions through the Chicot formation. A large portion of the water present in the formation is estimated to originate from direct recharge compared to later inflow from areas updip from Brazoria County. It is conceivable that limitations placed on pumping in this layer may provide relief from short-term impacts related to groundwater supply during drought conditions. However, the current monitoring that has been conducted for the Chicot formation within the County has not conclusively demonstrated a seasonal influence on water levels that may encourage such a policy.
- Economic consequences to existing users (i.e., cost to drop pumps, reconfigure or drill new wells upon water table dropping, etc...). Also consider the reverse—economic consequences of less water available to protect the existing users from the economic consequences relevant to existing users—reaching a balance between these two dynamics
 - The District has not yet engaged in a cost-benefit analysis of potential regulations in order to achieve the DFC versus the cost of impacts to existing users. The economic impact of subsidence, as demonstrated in Harris County and Galveston County between 1906 and 2000 (http://hgsubsidence.org/wp-content/uploads/2013/07/SubsidenceMap1906-2000.pdf), would be significant.
- Those GCDs with existing rules developed based on the current DFC might find it helpful to review the rules that the GCD considers relevant as we work to adopt DFCs over the next 2 years. For example, the rules and Management Plan in place based on the current DFCs can help determine how a GCD currently impacts private property rights and whether those same interests are important as we work to adopt DFCs over the next 2 years
 - \circ N/A
- Focusing on finding a balance, as that balance is defined by each GCD, between all of these considerations
 - The District will continue to strive to provide a balance between the protection of current resources, protecting property from land subsidence and protecting wells currently in production. The District will also plan for future water demand balancing existing wells and those that may be developed in the future (wells drilled to develop currently unutilized groundwater resources).

UPPER GULF COAST AQUIFER PLANNING AREA (GMA 14)

Joint Planning Group Meeting

Tuesday, November 18, 2014 1:30 PM

MEETING MINUTES

A regular meeting of GMA 14 was held Tuesday, November 18, 2014, at 1:30 PM, in the board room of the Lone Star Groundwater Conservation District located at 655 Conroe Park North Drive, Conroe, Texas.

The meeting was called to order by Kathy Turner Jones (Lone Star GCD) at 1:30 PM with a roll call of District representatives and Interlocal Agreement Participants, Districts represented included: Brazoria County GCD (joining at 2:15 PM), Bluebonnet GCD, Lone Star GCD, Lower Trinity GCD and Southeast Texas GCD. Interlocal Agreement Participants included: The Honorable John Brieden, Washington County Judge; Robert Thompson, Fort Bend Subsidence District, and Mike Turco, Harris-Galveston Subsidence District. Also in attendance at the meeting were: Jason Afinowicz, Freese and Nichols, Inc.; Larry French and Nathan Van Ourt, Texas Water Development Board (TWDB); Bill Mullican, Mullican and Associates; and members of the public (see Attachment "A" for a list of attendees).

Mr. Nathan Van Ourt was introduced by Mr. Larry French as a member of the Groundwater Technical Assistance section and will be the point of contact for GMA 14.

With no registered public comment, Ms. Jones proceeded with receipt and requests of posted notices from District representatives. Ms. Jones then asked for consideration of the approval of the minutes from the GMA 14 meeting on September 23, 2014. After discussion and upon a motion by Mr. Jacobs, seconded by Mr. Martin the minutes for the September 23, 2014 meeting were approved unanimously.

Ms. Jones next opened the floor to discussion and possible action regarding approval of a resolution establishing administrative procedures for the consideration, proposal, and adoption of desired future conditions (DFCs) for aquifers for GMA 14. Ms. Jones noted that the agenda was designed under the assumption of approval of the procedures given no additional comments were received. Mr. Martin opened discussion related to Section 2.02 language of GCD Board documentation of GMA representative. Mr. Martin assumed that all of the representatives had been delegated by their respective Boards, but was unsure how, or if, that had been documented by or reported to the GMA. Ms. Shauna Fitzsimmons of Sledge Fancher PLLC was recognized to assist in answering the concerns. Ms. Fitzsimmons clarified that this was a procedural measure

carried over from other GMAs and focused on the future administrative procedures moving forward. Ms. Fitzsimmons suggested striking the language of a Board President's action to appoint the GMA representative to be reflective of the current works and construction of the GMA. Mr. Holland noted that there should be some documentation in minutes identifying representatives by GCDs, if not in the GCD minutes dating back to the inception of the GMA process. Ms. Jones commented that Lone Star GCD documents representation on the GMA to be a responsibility and duty of the position of the General Manager, not a specific person, in order to maintain efficiency and Board action in the case of a name change. To alleviate the issue raised, Mr. Martin made a motion that the Resolution be amended by striking Section 2.02 and Section 2.03 was amended to reflect the strike and the current structure of the GMA representation and documentation, as laid out by Ms. Fitzsimmons. Mr. Holland seconded the motion. With no further discussion, the motion carried unanimously.

Meeting convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

The GMA 14 Joint Planning Interlocal Agreement Participants meeting was called to order at 1:44 PM

Ms. Jones began this portion of the meeting with a briefing and discussion of the feasibility of achieving the desired future conditions under consideration, as required by Texas Water Code Chapter 36.108(d)(8). Mr. Mullican was given the floor for a presentation (see Attachment "B" for presentation). He gave a refresher of where the GMA has been and where the GMA is at present and moving forward. From September 2013 to June 2014, Freese & Nichols executed two GAM Runs. The second run addressed adjustments to pumping levels and pumping locations in Brazoria County and Montgomery County. The second model simulation and the corresponding draft statements of desired future conditions were presented to the GMA at the June 2014 meeting. That simulation has been the foundation of the considerations the GMA has compared and run through the desired future conditions criteria found in 36.108 (d) (1-9). It was noted that to this point, GMA 14 District representatives have completed a preliminary consideration of the first seven criteria. With the presentation of the last criteria today, and with the action taken with the resolution establishing administrative procedures for the consideration, proposal, and adoption of desired future conditions, we will consider action to take draft DFCs statement from June 2014 to start the process at the next meeting to run through the full criteria

Mr. Mullican outlined his evaluation of the feasibility of achieving the DFCs under consideration. Mr. Mullican stated that to meet the requirements of this "consideration", it is very important to recognize and understand the historical perspective of the joint-planning process. When HB 1763 first passed, it was simple in directing GCDs to adopt DFCs. If someone

did not like the DFCs, they could petition the TWDB to determine if the DFC was reasonable, but there were no protocols for procedures on which to base this determination. Shortly after the legislation passed, members of the TWDB began expressing concerns at being forced to be the judge and jury on the DFCs without knowing what they were supposed to be reviewing or considering in making the determination of reasonableness. Therefore, the TWDB amended its rules related to the petition process to include a number of elements or factors that the TWDB would consider to determine reasonableness. Adopting the amended rules prior to submission of DFCs during the first round of joint-planning was important to ensure that the rules would not be criticized for protecting established DFCs. One of the criteria of those rules included a question of whether the DFC was "physically possible". Physically possible and physically compatible are the two references from the rules which were factored for this consideration under the old rules. However, with the passage of Senate Bill 660 in 2011, the feasibility requirement is now in statute, and thus no longer is necessary to be included in TWDB rules. Therefore, the GMA will need to rely on the former TWDB rules regarding the feasibility or in other words (physically possible) as the legislative intent. The test for TWDB through the petitions received at the conclusion of the first round of joint planning was to see if the DFC could be modeled using the TWDB's official groundwater availability model (GAM) for the aquifer in question to determine if the adopted DFC was physically possible. The GAM must abide by the laws of groundwater flow to be successful. If the model is successful with the parameters placed within and reflected an outcome not contradicted or negated by real world data, the DFC was determined to be physically possible and met the test. For the most part, this test came pretty close as outlined in an example from the Panhandle (GMA 1). However, there were also examples where the test failed a DFC. With the pumping estimations provided and input into the HAGM, the model being successfully executed, and by the results in the draft statement of DFC from the June 24, 2014 meeting, Mr. Mullican concludes that the DFCs are physically possible and therefore feasible. There is an enhanced expectation from this process in the current round of joint planning. The GMA has a tremendous amount of information which has been made available for review and consideration into this step. Where there are not direct correlations to be made between the supply and demand projections, consideration might be possible. Mr. Mullican concluded his presentation reiterating the differences from the first and second rounds of joint planning considerations and asked for guidance and recommendations of different or additional ways the GMA wishes to evaluate feasibility. He gave an example of median groundwater historical use on county by county basis compared to estimates of modeled available groundwater (MAG). It was noted that all but two counties have MAGs in 2070 that are greater than historical use. Mr. Mullican asked for each representative participant to weigh in on the subject matter.

Mr. Martin voiced his thoughts of approval of the way the item was laid out and that the DFCs appear to be physically possible. Judge Brieden also liked the layout from the models in relation to where we are today and moving forward. Mr. Jacobs echoed the previous comments and added that the GMA seems to be in a better place than through the first round. Ms. Jones added

appreciation for the information provided and the discussion on such topics. Mr. Holland noted the concern and lack of guidance with relation to feasibility compared to the other criteria. He believes we are in a good spot especially considering the change in model and the localized updates and we're within the bounds of the model, like it or hate it.

Ms. Jones recognized a question from the public, Mr. Bill Goodrum of Forestar Group. The question read into the record by Ms. Jones asked how the total estimated recoverable storage (TERS) would be factored into the DFC. Mr. Mullican stated that the TERS are part of the criteria which must be considered in the development of the DFCs. Mr. Goodrum stated that he was still unclear on the issue and restated the question by stating that if you look at the total amount of water in storage and you compare it to the MAG, the two don't jive. How does what you model as available compare with what is shown in storage? Mr. Mullican outlined that the GMA is tasked with achieving a balancing test between the highest practicable use and the duties to conserve and manage the groundwater resources. There is some question as to whether or not the TERS are practicable and there has been much debate thereof. The balancing test will have to be documented and defined by the GMA and has been part of the discussions leading through all of the criteria. Mr. Mike Thornhill of Thornhill Group followed up with a question of how the conversations and discussions related to TERS will be articulated in the explanatory report. Mr. Mullican stated that the meeting minutes, specifically the September 23, 2014 meeting minutes, would be used to extrapolate comments for the discussion. Mr. Thornhill asked for a general summary of what that would technically be now. Mr. Mullican again reiterated the use of minutes of the discussions, specifically with regards to private property rights, which were very substantive. With no further questions, Ms. Jones thanked Mr. Mullican for his presentation.

Ms. Jones called for a discussion of funding levels, participation, and any other aspects of the Interlocal Agreement. The GMA was reminded of discussions at the last meeting of the financing of the consulting contracts and where there was a portion of the consulting contract inadvertently left off at the time of the original pledges creating the deficit. Mr. Burkett worked to create a proposal off of the sets of financials laid out by Ms. Jones. Lone Star GCD has also incurred the legal expenses in relation to the administrative procedures development and is requesting the GMA to reimburse a portion of those costs, as requested by the Lone Star GCD Board. Ms. Jones tabled the action until the end of the meeting to allow Mr. Burkett to continue to put the numbers together for a proposal.

Ms. Jones asked for any presentations and discussions by Districts of recent activities of interest to or impacting the GMA 14 planning group. Mr. Holland noted that Bluebonnet GCD had recently updated the rules for the District at the October meeting. Ms. Jones commented that Lone Star GCD has been working on amendments to rules and regulatory plans. They have held hearings and a public workshop to address questions and provide information.

With no further discussion in terms of recent activities or interest to the GMA planning group Ms. Jones adjourned the meeting of the GMA 14 Interlocal Agreement Participants and reconvening the Joint Planning Group meeting at 2:23 PM.

Ms. Jones called for the discussion and possible action to approve DFC(s) option(s) for formal consideration by the district representatives of GMA 14 pursuant to the previously adopted administrative procedures for the consideration, proposal, and adoption of DFCs for GMA 14. For the record, in accordance with the previously approved administrative procedures, this DFC option was provided in writing to the Member Districts and the contracted consultant at least 14 days prior to today and reviewed by the contracted consultant at least seven (7) days prior to today. A two-thirds vote is required for passage. Ms. Jones outlined the email dated November 4, 2014 and called for discussion or comment and reiterated that this is not the final vote but to advance the draft DFCs through the procedures developed. Mr. Mullican outlined the procedures adopted to formalize what is required by the GMA to go through all formal considerations of the eight factors. This action is again to advance the draft DFCs through the procedures and at the next meeting perform the formal consideration of draft DFCs against the eight criteria. Approval of this action will require this draft to be documented and formally considered in the explanatory report. Mr. Holland asked if the vote was only on the DFCs included in the memorandum or the full text with preamble included. Mr. Mullican noted that the action is only for the DFC; everything else will result from action moving forward. Mr. Holland commented to the wishes to flesh out documentation of the HAGM, the DFCs, and specifically to his District, the use of subsidence numbers. Mr. Mullican noted that a technical report would be included to document the development of the HAGM and that each District will receive a draft explanatory report open to feedback and recommendations. Mr. Holland asked for additional clarification regarding the process for DFC adoption. Mr. Mullican asked the Chair to allow some discussion related to the next agenda item of briefing and discussion of progress to date for GMA 14 and remaining requirements and schedule. With approval, Mr. Mullican outlined that the GMA at its next meeting could potentially approve the DFCs and begin the individual District's hearing schedule clock to receive feedback and comments from the public on the DFCs and supporting materials. It will be a very long meeting, there will be an action item on the agenda, but he does not feel there is high likelihood of that action being taken at the next meeting, possibly a month later, Mr. Holland asked if there is a rush for this action today. Due to the lack of action on the procedures at the last meeting because they were inadvertently left off the agenda, Mr. Holland voiced discomfort for acting on the procedures which were not approved or in place at the time we began disseminating the information. The resolution was adopted today and therefore the deadlines and procedures began today. Mr. Mullican noted that there would be a necessity for another meeting if the action was not taken today. Ms. Fitzsimmons added the procedures adopted require four votes for approval and this action is very preliminary and through written request and indicates that these DFC options rise to the level of formal consideration and there is another step for action. As we are past this point, these procedures are primarily for future DFC development and to have that administrative record set. Mr. Holland voiced his appreciation for

the work and explanation and wanted to ensure that having the procedures seemingly employed retroactively would not create legal or defensible issues. Ms. Fitzsimmons reiterated that it would not create any of these issues and that it is ultimately the decision of the GMA Member Districts. This action does not shut the door to any other written requests for other or future DFCs. With no further discussion, Ms. Jones entertained a motion to approve the DFC options for formal consideration by the district representatives as required by the adopted Administrative Procedures for the Consideration, Proposal, and Adoption of Desired Future Conditions for Groundwater Management Area 14, Section 3.03. The motion was made by Mr. Burkett and seconded by Ms. Jones. The motion carried with a vote of 4-1, Mr. Holland voting nay.

Ms. Jones called for discussion of the next meeting date and briefing of progress, remaining requirements and schedule moving forward. Mr. Mullican reiterated his previous discussion of the next meeting to walk through the draft DFC options in relation to the criteria. The goal is to have the draft documents for review at the next meeting at least a few weeks prior, depending on scheduling. The next meeting date was discussed and set for Tuesday February 24, 2015, at 1:30 PM at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303.

Ms. Jones called back the discussion related to the funding levels, participation and other aspects of the Interlocal Agreement, Ms. Jones will work with Mr. Burkett to formulate into a spreadsheet the calculations for presentation at the next meeting.

Ms. Jones asked if there were any other questions or comments from the public, Ms. Jill Savory of Fort Bend County commented that she completely disagrees with the formation of the DFCs and believes they do not represent everything adequately. Without further discussion or comment and there being no further business, the meeting was adjourned at 2:50 PM.

PASSED, APPROVED, AND ADOPTED THIS day of 1

UPPER GULF COAST AQUIFER PLANNING AREA (GMA 14)

Joint Planning Group Meeting

Thursday, May 28, 2015 9:00 AM

MEETING MINUTES

A regular meeting of GMA 14 was held Thursday, May 28, 2015, at 9:00 AM, in the board room of the Lone Star Groundwater Conservation District located at 655 Conroe Park North Drive, Conroe, Texas.

The meeting was called to order by Kathy Turner Jones (Lone Star GCD) at 9:08 AM with a roll call of District representatives and Interlocal Agreement Participants. Districts represented included: Kent Burkett, Brazoria County GCD (joining at 9:24 AM), Zach Holland, Bluebonnet GCD, Kathy Turner Jones, Lone Star GCD, Gary Ashmore, Lower Trinity GCD and John Martin, Southeast Texas GCD. Interlocal Agreement Participants included: The Honorable John Brieden, Washington County Judge; Pudge Willcox, Chambers County; Robert Thompson, Fort Bend Subsidence District, and Mike Turco, Harris-Galveston Subsidence District. Also in attendance at the meeting were: Jason Afinowicz, Freese and Nichols, Inc.; Larry French, Texas Water Development Board (TWDB); Bill Mullican, Mullican and Associates; and members of the public (see Attachment "A" for a list of attendees).

Ms. Jones welcomed everyone to the meeting and recognized District Representatives, Interlocal Agreement Participants, Agency Representatives, staff, and consultants for introduction.

Mr. Ken Kramer, representing as the volunteer Water Resources Chair of the Lone Star Chapter of the Sierra Club and himself as a resident living and owning property within GMA 14, was recognized to address the group with public comment. Mr. Kramer noted he has been involved with water issues in Texas for over four decades. One of the things the Sierra Club and himself have focused on is marshalling groundwater and surface water resources to be sustained over time to provide and protect growth, values, and a strong environment. All GMAs have encountered controversial issues, but it is important to maintain focus on generations and be conservative of those resources. Mr. Kramer encouraged the GMA members to stick to their guns to make sure the decisions made allow people in the future to have the groundwater resources we currently enjoy for decades into the future. He looks forward to working with the GMA as the process continues and supports the efforts of groundwater conservation. With further public comment registered for Agenda Item #7 presentations, Ms. Jones proceeded with receipt and requests of posted notices from the group. Ms. Jones then asked for consideration of the approval of the minutes from the GMA 14 meeting on November 18, 2014. After discussion

and upon a motion by Mr. Martin, seconded by Mr. Holland the minutes for the November 18, 2014 meeting were approved unanimously.

Ms. Jones next recognized Mr. French for a presentation of information from the TWDB and discussions of items of interest to the GMA. Mr. French noted TWDB is currently reviewing the initially prepared plans (IPPs) submitted by the 16 regional water planning groups (RWPGs). The final regional water plans are due to the TWDB in January, 2016. Mr. French also stated that the TWDB is working to accelerate their process to adopt the State Water Plan in 2016. Typically the timeline for adoption is late in the year, however the TWDB is considering moving up that official adoption timeline to possibly the middle of or even earlier in 2016 to take advantage of and accelerate providing more SWIFT funding for approved projects. When the TWDB takes the action of adoption of the 2017 State Water Plan, whatever DFCs have officially been adopted by the GMA as of that date will be the DFCs required to be implemented by the RWPG in preparation of the 2021 regional water plans and 2022 State Water Plan. If the GMA wants to insure their current DFCs being worked on are implemented into the next State Water Plan, the official GMA adoption must occur prior to the TWDB adoption of the 2017 State Water Plan. For example, if TWDB adopts the State Water Plan mid-2016, GMA adoption proposals would have to occur 6-9 months prior to that adoption. Now RWPGs can have the option of using DFCs adopted subsequent to that timeline and would likely do so, but they are not required to do so. That potential schedule change was of interest and needed to be passed along for the knowledge and understanding of the GMA and concluded the item of news from TWDB.

Meeting convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

The GMA 14 Joint Planning Interlocal Agreement Participants meeting was called to order at 9:19 AM.

Ms. Jones noted this item is placed on today's agenda to offer an opportunity for others to discuss the possibility of considering alternative DFC options in addition to those options currently under formal consideration. With that said, it is important to note to our public attending today, as required by the administrative procedures adopted by GMA 14, for a DFC option to be formally considered as a potential candidate for proposal and adoption by the District Members, the DFC option must be requested in writing and approved by the Member District Representatives for formal consideration. A district representative must request a DFC option to be approved for formal consideration by submitting, no less than 14 days before a GMA 14 joint planning meeting, a written request to each Member District and the Contracted Consultant, in this case Bill Mullican and Freese & Nichols. As Ms. Jones was about to open the

, 🐐

floor to the agenda item, Mr. Martin raised a point of order (see Attachment "B" for the point of order). Ms. Jones thanked Mr. Martin for his point of order and moved into the agenda item of receiving technical presentations from entities/individuals in GMA 14 who desire to propose possible alternative desired future conditions options from those currently being discussed in the joint planning process. All entities/individuals appearing before GMA 14 for this agenda item were afforded 15 minutes to make technical presentations on alternative desired future condition options. All proposed alternative desired future conditions options presented will be documented in the GMA 14 Explanatory Report.

Mr. Mike Massey representing Lake Conroe Communities Network (LCCN) was recognized and asked to formally introduce himself and who he represents. Mr. Massey proceeded to provide comments from a handout (see Attachment "C" for LCCN comments).

It was brought to the attention of the Chair that there needed to be action taken on Mr. Martin's point of order. Mr. Martin made the motion to accept the point of order. Mr. Holland asked for clarification of the desired action from the point of order, and added that it was his understanding that the point of order meant that the group would hear the presentations with the understanding that any alternative desired future conditions options possibly proposed are not raised to formal consideration due to their not being included to date through the GMA 14 administrative procedures. Mr. Martin confirmed that all we are hearing is the presentations at this time. Ms. Jones added that was the intent of the agenda item. Judge Brieden seconded the motion. With no further discussion, Ms. Jones called for a vote which passed 8-1 with Mr. Holland voting against.

Ms. Jones next recognized Mr. Michael R. Thornhill, P.G. of Thornhill Group, Inc. representing Montgomery County Investor Owned Utilities (see Attachment "D" for Thornhill presentation slides). Mr. Thornhill began by acknowledging Mr. Martin's comments and noting that while his presentation would center on work and discussions performed in Montgomery County, they would be presenting alternative desired future conditions options for consideration to Lone Star GCD as well as the other District Members as he believes the desired future conditions should be aquifer wide. He then proceeded with his presentation.

Next, Ms. Jones recognized Ms. Susan Butler of CH2M, presenting on behalf of Mr. Bill Goodrum, with Forestar Real Estate Group. Ms. Butler presented prepared comments to the group (see Attachment "E" for Forestar comments). Ms. Jones added comments regarding the participation of Liberty County in the GMA as an Interlocal Participant. Liberty County was a participant in the initial planning cycle. When the efforts began to move forward with the current cycle the GMA reached out multiple times to welcome them back. Unfortunately the Commissioners Court did not feel the need to participate. Ms. Jones encouraged Forestar to communicate and try to renew the interest of the Commissioners Court as well.

Ms. Jones recognized Mr. Marty Jones of Sprouse, Shader, Smith PLLC, an attorney representing Quadvest and Stoeker Corporation. Mr. Marty Jones expanded on a brief point

made earlier by Mr. Thornhill with his presentation (see Attachment "F" for Jones presentation slides). He concluded his comments that property rights may be affected by the use of political subdivision lines as discernible, substantial differences in uses or aquifer conditions in establishing DFCs and a more prudent approach would be to adopt a single DFC for the aquifer on the whole to distance the GMA from legal challenges of "discernible, substantial differences" between political lines.

Ms. Jones recognized Mr. Kevin Spencer of R.W. Harden & Associates, Inc., representing the City of Conroe. Mr. Spencer focused his presentation on artesian aquifers, specifically the Jasper layer of the Gulf Coast Aquifer, and storage-based DFCs as possible alternatives (see Attachment "G" for Spencer presentation slides and handout). Mr. Spencer concluded his presentation by acknowledging that though their desired alternative was not being proposed or considered today, they wanted to throw out a number of 95% of the total storage remaining in 2070, stating that it would be completely achievable, easily monitored, and account for effects of all pumpage and the regional nature of the aquifer.

With no further discussion in terms of recent activities or interest to the GMA planning group Ms. Jones adjourned the meeting of the GMA 14 Interlocal Agreement Participants and reconvening the Joint Planning Group meeting at 10:23 AM.

Ms. Jones called the next agenda item of a discussion and consideration of approving eligible DFC options to be formally considered as a potential candidate for proposal and adoption according to Administrative Procedures for the Consideration, Proposal, and Adoption of Desired Future Conditions for GMA 14, Section 3.04. Ms. Jones noted that today the GMA will be taking a vote for the approval of the only DFC option currently under formal consideration by the District Members. To date, the GMA has completed its consideration of the nine criteria required by Section 36.108(d) (1-9) of the Texas Water Code prior to the adoption of proposed DFCs. Ms. Jones added that now, according to the GMA 14 administrative procedures, District Representatives need to approve the DFC option as a candidate for adoption as a proposed DFC. At the next GMA 14 meeting we will have the opportunity to vote to approve the DFC as the proposed DFC. Mr. Martin asked about a tentative date for scheduling the next GMA 14 meeting to move the process along. Mr. Martin emphasized the importance of moving the process along and not derailing too much and proposed June 24, 2015 at 9:00AM. Mr. Holland opened discussion referencing the presenters/presentations expressing their intent to work directly and primarily with Lone Star GCD to propose either DFC alternatives or amendments to the currently considered options. From his understanding of the administrative procedures, prior to the point of order action taken, the GMA had the option of taking any proposals from the presenters/presentations and amending the considered options. Part of Section 3.04 is going through each DFC and outlining the relation and consideration of the nine factors. Mr. Holland then asked for clarity, as to whether or not that is a discussion for today's meeting or for the next meeting. Mr. Mullican responded that when the group adopted the administrative procedures in November, there was some discussion of the fact that the group has already been through the

۸,

nine factors. The question then is, are we going to go all the way back through all of the discussions for this one particular potential DFC. Mr. Mullican then pointed out that is was generally agreed to at that point and time that in some form we had already had several meetings worth of discussions and considerations of the factors and there were three options on the table. With the documentations in the minutes, the GMA could ratify all of the consideration discussions to the DFC consideration. Or the GMA could come back and present an executive summary of the presentations and information presented over the last couple of years. The third option was for Mr. Afinowicz and Mr. Mullican to schedule an all-day meeting and go through them at the same level of detail that the group went through the originally. Mr. Holland asked for clarification that where the GMA is today is moving the current considerations forward to the next meeting for consideration as the adopted DFC for action and starting the 90-day public hearing process. Mr. Mullican noted that according to the Administrative Procedures Section 3.04, GMA 14 District Representatives would elevate the DFC to go through the considerations of the nine factors. Mr. Martin then asked if a summary of the nine considerations would be sufficient, as the considerations have already been discussed. Mr. Mullican remarked that it could be as simple as ratifying all of the discussions the group had in the past, However, Mr. Mullican also pointed out that on a couple issues, for example socioeconomic impacts, private property rights impacts, and even feasibility, there was at least an implied commitment that we would revisit to ensure the list of socioeconomic impacts, private property rights impacts, and the approach taken on the feasibility analysis was still agreeable with everyone. Mr. Mullican suggested a somewhat extended executive summary overview of exactly what we have covered up to this point. Mr. Martin inquired of the time needed for such a review. Mr. Mullican commented that between Mr. Afinowicz and himself it could be taken care of in a couple of hours. Mr. Mullican summarized that the vote today is to make the potential DFC approved in November under Administrative Procedures Section 3.03 eligible to go through the nine considerations. Mr. Martin asked if we had actually done that at the last meeting. Mr. Mullican stated that they had not, and asked that the group recall there are four (4) votes required for DFCs. If a DFC is submitted to the GMA for consideration you first have to vote that it is official because somebody may walk in asking for artesian pressure to be restored to pre-1900 levels and you don't want to document that in the explanatory report, so it would never rise to passing the first hurdle. The second vote is to formally say this DFC is to be run through the nine considerations, but doesn't mean that you aren't going to add other DFC considerations, just that this DFC has risen to the level of considering the nine factors. Mr. Mullican then presented a draft document he believed necessary for the benefit of showing the significant events that have occurred over the past couple of years in relation of our progression of the DFC process. Ms. Jones stated that the Lone Star GCD Board has discussed their position regarding this matter and realizes there will be potential alternative DFCs presented to the Lone Star GCD for consideration, but at this time the Lone Star GCD Board feels we need to move forward but want to make it known to the public and GMA 14 that should these alternative DFCs be brought to and approved by the Lone Star GCD, GMA 14 will then need to consider the potential

alternative DFCs, realizing that would be a cost to Lone Star GCD as part of the planning. Mr. Holland questioned the process outlined in the administrative procedures for further clarity. He asked whether or not moving these DFCs forward today, then to have Lone Star GCD propose an alternative DFC to be brought back to the GMA, is it amending the DFC that is at this point or are we starting the entire administrative procedures over; will or would we have agenda items for the Section 3.02, 3.03, and 3.04 to catch the alternative up to where we are at the present. Ms. Jones noted that we have to know more specifics before we can answer that, but that we don't want to slow down the train. Mr. Holland recognized the specifics of the request will determine how they have to be handled, but questioned if we can get all of that done at one meeting or are we looking at another three meetings process to get those alternative DFCs considered. Mr. Mullican commented the administrative procedures contemplate the ability of the GMA to run more than one potential DFC through the process. So at the next meeting, for example if these DFC options are approved to move forward, we will complete the consideration process on that potential DFC. At the same time, if Lone Star GCD submits their request 14-days prior to that meeting and everything needed is included for evaluation, the GMA could at that same meeting take action to begin the process, similar to the vote today, to run the alternative DFCs through the nine considerations. Mr. Mullican then stated that the GMA could not perform those considerations at that meeting because we would have had no preparation whatsoever to begin that consideration process, so we would have to perform that at a subsequent meeting. Mr. Burkett asked if there would be additional costs. Mr. Jones noted again that if Lone Star GCD were to propose an alternative DFCs for consideration, they would bear any additional costs associated with the alternative DFCs. Mr. Holland asked if it would be better to push the June considered meeting back an additional 30 days to provide opportunity for possible alternatives to be submitted and considered since we are looking at an additional meeting for any alternative to be run through the factors. Mr. Holland then asked if an additional 60 days allow enough time to conduct everything in a single meeting. Mr. Mullican stated that the vote on the eligible DFC options and meeting date are two different actions. Mr. Holland added that the whole purpose of the next meeting is to potentially take action on the DFCs to start the 90-day hearing process. Mr. Mullican stated that action would be eligible to be taken, but it wasn't mandatory or required at that meeting, just that we would be at that step in the process. Mr. Holland redirected that if alternatives DFCs are proposed at the next meeting, we would not be able to take action on the eligible DFC because we have other alternatives that are in the process but have not completed the considerations. Mr. Mullican stated that it all depends if the GMA decides to support the eligible DFCs or the alternatives DFCs as it takes a two-thirds vote. Mr. Holland reiterated that he is trying to clarify the process and make it as easy as possible on everybody. Ms. Jones noted that comments from Mr. French of the accelerated timeline TWDB is looking at for the regional water plan mentioned earlier in the meeting is something to keep in mind. Mr. Holland noted that the regional water plan is a major driver in this process and it had been his understanding from the beginning of this round of joint planning and the reason why we are much further along in the GMA process was the attempt to get on the same timeline as the regional plan. In trying to

٨

move forward, scheduling a June meeting where we may not be able to get anything done and then scheduling additional meeting, Mr. Holland noted his intentions to clarify and understand how to incorporate the administrative procedures and understand them in practice to best and efficiently utilize the time and efforts of everyone involved with the likelihood of alternative DFCs being proposed. Mr. Holland made the motion of approving eligible DFC options to be formally considered as a potential candidate for proposal and adoption according to Administrative Procedures for the Consideration, Proposal, and Adoption of Desired Future Conditions for GMA 14, Section 3.04. Mr. Martin seconded. Mr. Jones called for a record voted. Each member voted in the affirmative.

Ms. Jones asked Mr. Mullican if there were any further briefing and discussion of progress to date for GMA 14 and remaining requirements and schedule as the item had been well discussed in relation to the previous agenda item. Mr. Mullican noted that everything had been well covered. He asked the GMA members to remember that whenever the GMA does finally adopt a proposed DFC we will get back together all of the information reviewed and used throughout the entire process of your considerations which will take a small amount of time to accumulate.

Ms. Jones asked for any presentations and discussions by Districts of recent activities of interest to or impacting the GMA 14 planning group. Ms. Jones commented that Lone Star GCD's hearings and public workshops and the work on amendments to rules and regulatory plans had been well aired through the events of the meeting.

Mr. Jones called for discussion of next meeting date, location, and agenda items. Ms. Jones asked for a note for future agenda items to have a financial item to allow for more robust discussions and noted that copies of the financials are at the seats of the members and interlocal participants. In recalling earlier discussions of possible meeting dates, Ms. Jones asked for further discussion and proposal for dates and times. Mr. Burkett followed up on a more clear answer to Mr. Holland's previous inquiries. If this body wanted to consider or progress the DFCs on the table as well as having the option of considering other alternative DFCs, in terms of times and number of meetings, how best would we accomplish those two tasks, i.e. further consideration of current DFC and leaving option open for consideration of other DFCs. Do we have a meeting in June or is it postponed to a later date to give consideration of those factors? Mr. Mullican responded that this represented two different questions. The first question is how long do we delay or allow for, if in fact Lone Star is going to hear and adopt alternative DFC consideration, Mr. Holland noted the June meeting gives two weeks to get something presented and approved through the Lone Star Board and get the 14 day requirement met. Ms. Jones added how or what would be added or play into an anticipated June agenda. Mr. Mullican stated that the Lone Star Board Meeting is June 9th, 14 day deadline is June 11th. That would mean in one meeting you would be getting a presentation and the Board would be agreeable. Ms. Jones stated that it is unlikely that timeline could be met and added that she is not suggesting we don't go with July but that we may not even be ready then. We would want the opportunity for review and ample consideration of anything presented to the District. Mr. Burkett added that right now we

only have one DFC on the table and he feels certain based on comments and presentations today that there will be alternatives proposed. Mr. Burkett noted that Lone Star GCD will take those under consideration and if recommended, the body of GMA 14 will want to take those under consideration, so therefore there are two or more meetings. Mr. Mullican stated there would be at least two meetings. If Lone Star GCD were to approve an alternative DFC in time for this round of joint planning, GMA 14 would have to have at least two meetings to resolve the considerations and would likely be looking at three meetings. Mr. Martin interjected and recognized his District's attorney Mr. John Stover. Mr. Stover stated the GMA has been working on this process for over a year and now after the ship has already sailed, Conroe wants the GMA to recall it. Mr. Stover then stated that based on the presentations today he felt there will be alternatives but he is very positive it will have impact to the drawdowns on the DFCs for every District present. His question was why accommodate the City of Conroe at this point. Mr. Stover added that, "They have been sitting around for three years, knowing what is going on here. My client has spent a lot of time and money to get where we are today and it does not matter if Lone Star GCD picks up the tab, it is just too late. When somebody is going to impact you negatively that has to be what will happen with these proposals, if they have something that will mitigate that why did they not show it today. It is not in the interest of the GMA to slow down today for Conroe who has finally looked at the picture and said they don't like this. My client wants to move forward and the GMA has the ability to modify these DFCs annually and let Lone Star and these people work on their problem, come back later in the process and modify it then". Mr. Burkett asked if there were other legal counsel present for Districts who would have anything to add to the comments from the standpoint of the GMA or individual Districts. Mr. Greg Ellis was recognized, representing Harris-Galveston Subsidence District, Fort Bend Subsidence District, Brazoria County GCD, and Lower Trinity GCD, and noted that it is up to the individual districts to present whatever DFCs it determines are relevant. He did concede that this does seem late in the process to be relooking at options. Follow the best policy for your district, there is nothing legally binding outside of 36.108 for considerations and doesn't say which DFC must be considered or not. Ms. Jones drew discussion back to setting a date that works for everyone. Mr. Martin commented he was not worried about being accommodating and proposed June 25, 2015 at 9:00AM as being about 30 days from today to allow us to move forward. Mr. Burkett recalled from earlier discussions June 24, 2015 was discussed and asked if it was an option. Mr. Turco noted that as long as it was a morning meeting it would allow him to get back for his board meeting that afternoon. Mr. Martin amended his motion to Wednesday June 24, 2015, at 9:00 AM at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303, seconded by Mr. Burkett. With Ms. Jones abstaining, the vote passed 4-0.

Ms. Jones asked if there were any other questions or comments from the public. Ms. Jill Savory, of Fort Bend County and soon to be a Montgomery County resident, commented that she completely disagrees with the DFCs and does see all the work, been to these meetings, and seen the non-questions being answered back and forth when Mr. Mullican presents things. And she

realizes there is a lot of money supporting wanting to hurry up and fund the DFC so other projects can move forward, but the problem she sees is the information in the models. She prepared an entire presentation during the Fort Bend and Harris County Groundwater hearing here recently and provided substantial evidence on how USGS groundwater resources division has neglected some of their duties and she highly recommended downloading the presentation from the website or she would be happy to provide you a copy. She thinks moving forward; having a reason to adopt a DFC would be a wise decision. She further stated that she knows the group thinks that what they are doing is helping move progress along, but if you do not have a problem to begin with she does not see the need to move forward. One of the many things she has brought to several people's attention, if your DFC is based on what the water levels are in these wells and essentially already know it is a conflict of interest of boundary laws of jurisdiction of a governmental body and urge caution in adopting DFCs. Mr. Marty Jones was recognized to clarify his point that the City of Conroe is proposing additional DFCs to Lone Star GCD, and that the intent of the City of Conroe is to present an alternative DFC at least for the Jasper Aquifer to all GCDs in the GMA. Mr. Scott Weisinger, Lone Star GCD Board Member, was recognized and wanted the GMA to know that the Lone Star GCD got a letter from Austin from the local legislative delegation that asked the District to slow things down. This isn't something that was just generated within Montgomery County, we got a letter. Mr. Weisinger stated that there is a lot going on that GMA 14 did not know and are not getting all the information. Ms. Jones added that anyone who would like a copy of that letter can contact her and it will be provided. Mr. Willcox added a comment of his feelings of strong support of public input to decision issues. It sounds like 95% of the problem is going to have to be changed in Austin. In hearing all of the presentations today, this group has followed what it is bound to in State Law. My point is, you really need to start now for the next legislative session and make visits to the committees and representatives when the whole ballgame is in their court and we are trying to do what they have said to do. If an entity does not follow what the State has outlined, the entity is disqualified from substantial assistance. Keep talking and move the discussions higher as well.

Without further discussion or comment and there being no further business, the meeting was adjourned at 11:04 AM.

PASSED, APPROVED, AND ADOPTED THIS

Chairman

ATTEST:

Secretary

Fort Mel-1

UPPER GULF COAST AQUIFER PLANNING AREA (GMA 14)

Joint Planning Group Meeting

Wednesday, June 24, 2015 9:00 AM

MEETING MINUTES

A regular meeting of GMA 14 was held Wednesday, June 24, 2015, at 9:00 AM, in the board room of the Lone Star Groundwater Conservation District located at 655 Conroe Park North Drive, Conroe, Texas.

The meeting was called to order by Kathy Turner Jones (Lone Star GCD) at 9:00 AM with a roll call of District Representatives and Interlocal Agreement Participants. Districts represented included: Kent Burkett, Brazoria County GCD (joining at 9:47 AM), Zach Holland, Bluebonnet GCD, Kathy Turner Jones, Lone Star GCD, Gary Ashmore, Lower Trinity GCD and John Martin, Southeast Texas GCD. Interlocal Agreement Participants included: The Honorable John Brieden, Washington County Judge; and Mike Turco, Harris-Galveston Subsidence District. Also in attendance at the meeting were: Jason Afinowicz, Freese and Nichols, Inc.; Larry French and Natalie Ballew, Texas Water Development Board (TWDB); Bill Mullican, Mullican and Associates; and members of the public (see <u>Attachment "A" for a list of attendees</u>).

Ms. Jones welcomed everyone to the meeting and recognized Districts, Interlocal Agreement Participants, agency, staff, and consultants for introduction.

Ms. Jones proceeded with receipt and requests of posted notices from District Representatives. Ms. Jones then asked for consideration of minutes from the GMA 14 meeting on May 28, 2015. After discussion and upon a motion by Mr. Holland, seconded by Mr. Martin the minutes for the May 28, 2015 meeting were approved unanimously.

Ms. Jones next recognized Mr. French for comments from the TWDB and discussions of items of interest to the GMA. Mr. French noted the retirement of TWDB Chairman Carlos Rubenstein effective August 31, 2015. Mr. French went on to announce that Governor Abbott has named Board Member Bech Bruun as the new Chairman of the TWDB. Mr. French also mentioned four educational videos recently uploaded to the groundwater section of the TWDB website and encouraged everyone to view and utilize them.

Meeting convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

The GMA 14 Joint Planning Interlocal Agreement Participants meeting was called to order at 9:10 AM.

Ms. Jones noted the group would conduct the posted discussion of funding levels, participation and any other aspects for the Interlocal Agreement and take possible action after Mr. Burkett joined the meeting.

Ms. Jones called for a briefing by contracted consultants regarding any desired future condition (DFC) options requested in writing by a District Representative for formal consideration during the GMA 14 joint planning meeting in accordance with GMA 14 Administrative Procedures, Section 3.01 - 3.02 and recognized Mr. Mullican. Mr. Mullican noted that the GMA has not received any alternative options for consideration. Therefore, no action was taken.

Ms. Jones asked for the review and discussion of the statutory criteria considered by GMA 14 as set forth in Texas Water Code Section 36.108(d) (1-9) and in accordance with the GMA 14 Administrative Procedures. This item prompts the further review of the statutory criteria set forth in Texas Water Code Section 36.108(d) (1-9), which is consistent with the administrative procedures adopted by the GMA. Referencing the last GMA 14 joint planning meeting, the Member Districts approved the DFC option that resulted from the second run of the HAGM as a candidate for adoption as a proposed DFC for the Gulf Coast Aquifer System. Although in previous meetings GMA 14 District Representatives and Interlocal Agreement Participants have spent a great deal of time discussing the statutory criteria required in Section 36.108(d), Sections 3.04 and 3.05 of the administrative procedures instruct the GMA to further review this information now that the DFC option is eligible to become the proposed DFC. Ms. Jones recognized Mr. Afinowicz and Mr. Mullican to lead the discussion (see Attachment "B" Review of Proposed DFCs & Statutory Criteria from Texas Water Code Section 36,108(d) (1-9)), Mr. Mullican began with an outline of the discussions scheduled for the meeting (slides 2-3). Mr. Mullican noted each previous meeting which the statutory criteria were discussed individually for reference. In addition, he noted that after today's meeting, a specific agenda item for each of the nine factors will have taken place during at least two different meetings. Mr. Afinowicz then began a discussion focused on the groundwater availability model (GAM) update and GAM development summary (slide 4-6). Discussion continued with the model process and results which went into the formulation of the DFC statements (slide 7-36).

Mr. Afinowicz then began addressing individual criteria to be considered during the joint-planning process. First, Texas Water Code Section 36.108(d) (1) "aquifer uses or conditions within the management area, including conditions that differ substantially from one geographic area to another;" was discussed (*slide 37-68*). Mr. Afinowicz focused in particular on the differences in groundwater use that is recorded in the more urban counties in GMA 14 versus the much smaller levels of groundwater production that generally occurs in the more rural areas of GMA 14. The counties with the most significant levels of groundwater production in recent

history were highlighted as Harris, Ft. Bend, and Montgomery counties. Aquifer uses for recent history were presented at aquifer/county/GCD levels.

Texas Water Code Section 36.108(d) (2) "the water supply needs and water management strategies included in the state water plan;" was the next factor discussed (*slide 69-85*). Again, the demographic dynamics documented in the more urban areas of GMA 14 also recorded the greatest level of water supply needs in GMA 14. Water management strategies in the 2012 State Water Plan were discussed. It was highlighted that there are no water supply needs in the GMA 14 region for which recommended water management strategies are not sufficient to meet all projected water supply needs. Water supply needs were presented at a county level the 20 counties in GMA 14 along with county-specific recommended water management strategies.

Third, Texas Water Code Section 36.108(d)(3) "hydrological conditions, including for each aquifer in the management area the total estimated recoverable storage as provided by the executive administrator, and the average annual recharge, inflows, and discharge;" was discussed (slide 86-149). A significant portion of this discussion focused on the TWDB's report of total estimated recoverable storage for all relevant aquifers on a county by county basis throughout GMA 14. In addition, water budget information quantifying recharge, discharge, and crossformational flow was presented for all relevant aquifers on a county by county basis for GMA 14.

The next factor considered, as required by Texas Water Code Section 36.108(d) (4) "other environmental impacts, including impacts on spring flow and other interactions between groundwater and surface water;" was discussed (*slide 150-155*). It was noted that especially for the Gulf Coast Aquifer System, there is very little surface water – groundwater interaction regionally, except in outcrop areas. Furthermore, it was noted that due to the model architecture utilized in construction of the HAGM, there is no quantifiable level of interaction that can be extracted from the HAGM to provide additional information. It was noted, however, that studies just to the west of GMA 14 in the Lower Colorado watershed have documented this limited interaction in outcrop areas.

The fifth required factor, as stated in Texas Water Code, Section 36.108(d) (5) "the impact on subsidence" was discussed (slide 156-160). Mr. Afinowicz noted that the primary areas of subsidence in GMA 14 have been documented in Harris, Galveston, Ft. Bend, and Montgomery Counties. Mr. Turco stated that the PRESS model results were limited to the PRESS model sites that exist mostly within the Subsidence District. He went on to say that to this point in time, no one other than the Subsidence Districts have PRESS results. Further, the SUBS package in the HAGM was utilized for the rest of the GMA. Mr. Turco reiterated that the PRESS model results were limited to the PRESS sites that exist mostly within the Subsidence Districts (Harris, Galveston, Fort Bend counties)".

Mr. Mullican then led the GMA in a dissuasion of the next factor to be considered, as stated in Texas Water Code Section 36.108(d) (6) "socioeconomic impacts reasonably expected to occur" was discussed (*slide 161-176*). After a discussion of quantitative socioeconomic impacts of not meeting projected water supply needs based on information reported by Regions G, H, and I in the 2011 regional water plans respectively, Mr. Mullican provided an overview of socioeconomic impacts identified and discussed during the GMA 14 meeting on September 23, 2014 The following socioeconomic impacts from the proposed DFC options were reviewed:

- Proposed DFCs may require conversion to alternative supply, which may have increased costs associated to infrastructure, operation, and maintenance.
- Proposed DFCs may reduce/eliminate the costs of lowering pumps and either drilling or deepening of wells.
- Proposed DFCs may reduce/eliminate the costs associated with subsidence (including legal costs assigned to parties determined to be liable).
- Proposed DFCs may serve to sustain/enhance economic growth due to assurances provided by diversified water portfolio.
- Alternatives to proposed DFCs may result in short-term reduction in utility rates due to reduction in cost of water management strategy implementation.
- Alternatives to proposed DFCs may result in significant but unquantified production costs due to transition from confined to unconfined conditions in local aquifers.

Mr. Mullican asked for any further discussion from individual members on this item, Mr. Turco began by adding comments on work the Subsidence District has done to evaluate the impacts of subsidence on the region. Subsidence can have detrimental impact on development and growth of the area. He noted a study utilized by the Subsidence District from 1975 by Jonathan Larson which looked at these impacts from subsidence and made conclusions of costs of several billions of dollars associated with those impacts. More recent work done by the Houston Geologic Society looking at subsidence and related faulting which report that impacts on infrastructure easily climb into the billions of dollars, something the Subsidence District takes very seriously in their analyses. Mr. Mullican asked for references to those reports for documentation (see Attachment "C"). Mr. Holland noted the comprehensive list of socioeconomic impacts that has been developed summarizes and covers the vast array of positives and negatives as discussed to date. He does not believe that the DFCs are knowingly or intentionally leaning or emphasizing the negative and the goal is to balance or stay positive on this front end, acknowledging that they could change moving forward. Ms. Jones commented that Lone Star GCD is very in tune to these considerations and referenced the September 23, 2014 statement provided (see Attachment "D"). Mr. Burkett also referenced and re-read his statement from the September 23, 2014 meeting (see Attachment "E"). Mr. Ashmore had nothing to add to the discussion. Mr. Martin agreed that the list compiled was a good effort and emphasized that this is an ongoing process. Judge Brieden agreed with the discussions and wants to make sure that there is a balance from the outcrop to downdip areas. Mr. Mullican noted that this might be a good time to take a short

break. Ms. Jones agreed and briefly recessed the meeting at 10:25 AM before discussing the remaining factors.

Ms. Jones called the meeting back to order at 10:39 AM and returned the floor to Mr. Mullican to continue in the statutory criteria discussions. Mr. Mullican noted though there are nine factors for consideration, the ninth is "any other information relevant to the specific desired future conditions" which he has not received any additional information for consideration from GMA 14. Such request could be made at any time during the joint-planning process. The next factor considered, as stated in Texas Water Code Section 36.108(d)(7) "the impact on the interests and rights in private property, including ownership and the rights of management area landowners and their lessees and assigns in groundwater, as recognized under Texas Water Code Section 36.002;" was then discussed (slide 177-182). Mr. Mullican asked for further or additional discussion from individual members on this item. Judge Brieden began by referencing the previous discussion from September 23, 2014 and had nothing further to add. Mr. Martin noted the balance behind the DFC process aimed at protecting private property rights. He added that both today's meeting and previous meetings were valuable discussions. Mr. Ashmore and Mr. Burkett did not have anything further to add. Ms. Jones read the following statement into the record:

On September 23, 2014, the GMA 14 Member Districts and joint planning agreement participants held a public meeting to discuss the impacts on the interests and rights in private property in the development of DFCs for the relevant aquifers in GMA 14 pursuant to Section 36.108(d)(7) of the Texas Water Code. At the time of this discussion, the only DFCs on the table for consideration by the GMA were the DFCs that resulted from the HAGM Run No. 2, which are described in terms of acceptable drawdown levels for each subdivision of the Gulf Coast Aquifer, including the Chicot, Evangeline, Burkeville, and Jasper, for each county located within GMA 14.

On behalf of the Lone Star Groundwater Conservation District, I, Kathy Jones, General Manager and representative for Lone Star, provided a statement at the September 23, 2014, meeting that specifically addressed, in detail, the District's continued effort to consider and respect the private property rights of all landowners in Montgomery County. In this statement I also discussed the impacts to the private property rights based on the DFCs under consideration. This statement has been memorialized in the minutes from the September 23, 2014, public meeting.

To date, no other DFC option has been approved for formal consideration by the Member Districts of GMA 14. Thus, in revisiting the statutory criteria in Chapter 36 of the Water Code prior to voting on proposed DFCs, it is important to note the significant amount of work that the District has already completed in its consideration of the impacts to private property rights based on the DFCs currently before the GMA, as described in the statement I made at the GMA 14 meeting on September 23, 2014. Nonetheless, without restating everything that was said at that meeting, I would like to reiterate a couple important points on the topic of private property rights.

In 2001, Lone Star GCD was created as a solution to preserve and protect the groundwater recourses in Montgomery County. More specifically, the District was

created to address the increased water costs of pumping associated with declining water levels in the Gulf Coast Aquifer as a result of the continued population and economic growth in Montgomery Groundwater. After conducting various scientific studies, the District Board ultimately made the policy decision to manage the Gulf Coast Aquifer on a sustainability basis to ensure the long-term viability of the aquifer and the long-term ability of landowners to sustainably produce groundwater in order to protect private property rights in the county. In that regard, the District designated the total amount of groundwater to be available for production and use in the District as the amount of effective annual recharge to the Gulf Coast Aquifer within Montgomery County so that, in the long-term, groundwater levels would stop declining.

This strategy is reflected in the District Rules, the District Management Plan, the District Regulatory Plan, and the DFCs currently under formal consideration for Montgomery County. Overall, the strategy strikes a careful balance of protecting the property rights of historical users to realize their investment-backed expectations while allowing all property owners, including new users, in the county an opportunity to drill for and produce groundwater. For a more detailed analysis of the District's consideration of impacts to private property rights, please reference the September 23, 2014, meeting minutes or contact the District.

Mr. Holland commented that the detailed discussion from the September 23, 2014 meeting covered and documented this topic well. He echoed Mr. Martin's comments of the DFC process being a planning process. He added that he does not feel it was ever supposed to be the regulatory framework it has unfortunately warped into. When implementation occurs and there are different impacts or not working the way they were originally laid out or envisioned, it is his responsibility to bring them back to this group and get them changed. To be reflective of the real world while dealing and planning for water on paper should be the goal. Mr. Holland noted Texas Water Code Section 36.002 as the foundation and backbone on which groundwater conservation districts are formed. Mr. Turco did not have anything additional to add.

The final factor considered, Texas Water Code Section 36.108(d) (8) "the feasibility of achieving the desired future conditions" was discussed (*slide 183-190*). Mr. Mullican reviewed feasibility analysis presented to GMA 14 on November 18, 2014. This discussion included a review of the history of DFCs from a feasibility perspective, and how this has been utilized both in the past and the present as being a determination of whether or not a proposed DFC was physically possible. It was noted that in each case where this was an issue during the first round of joint planning, a DFC was determined to be physically possible if it could be modeled using the currently adopted GAM. Another element considered with respect to the question of feasibility is whether or not the GCDs represented have sufficient regulatory authority to develop, adopt, and enforce rules necessary to achieve the DFC. Mr. Mullican then concluded that since the proposed DFCs have been successfully modeled using the HAGM, and since all five GCDs in GMA 14 and the two Subsidence Districts have sufficient authority to establish and enforce rules necessary to achieve the DFCs, then it was his determination that the proposed DFCs are feasible.

Ms. Jones then recalled the item previously skipped to discuss funding levels, participation and any other aspects for the Interlocal Agreement and take possible action turning the discussion over to Mr. Burkett. Mr. Burkett noted the invoices from and payments to date for the consultants, pledges collected to date, and the general understanding of the remaining items to be completed for future invoices from the consultants. Mr. Burkett added if there is a balance at the next meeting, this body will be asked for guidance on addressing that balance at that time.

Upon a motion by Mr. Burkett, seconded by Mr. Turco, Ms. Jones adjourned the meeting of the GMA 14 Interlocal Agreement Participants and reconvening the Joint Planning Group meeting at 10:58 AM.

Ms. Jones reconvened the GMA 14 meeting and called for the discussion and possible action to approve any DFC options and amended DFC options submitted to GMA 14 by a District Representative to be formally considered in accordance with GMA 14 Administrative Procedures, Section 3.03. With no options or amendments submitted to GMA 14 by a District Representative, there was no action to be taken.

Ms. Jones asked for discussion and possible action to approve any DFC options currently under formal consideration to be further reviewed as candidates for evaluation in accordance with Texas Water Code Section 36.108(d) (1-9) and in accordance with GMA 14 Administrative Procedures, Section 3.04.

Ms. Jones recognized Mr. Marty Jones to address his public comment, Mr. Marty Jones stated that the importance of the GMA and DFC process today can't be understated. Jones noted that this planning process, as stated previously by Mr. Holland, becomes regulatory when the DFCs are adopted and then implemented into the five different GCD rules, and yet there are areas with no rules or implementation because they are non-GCD areas. Mr. Marty Jones referenced his discussion at the May 28, 2015 meeting. Mr. Jones proceeded to outline a specific example related to his client, Quadvest. Quadvest has a project which straddles the Liberty-Montgomery County line. He questioned if the hydrologic conditions right on the county line were so unique or different to justify different DFCs. He further expected the explanatory report to address that specific county line as the Jasper layer, for example, runs contiguous through across county lines. He concluded he sees no justification for these DFCs and outlined this concept of geographic boundaries being used for delineating DFCs in a previous letter in relation to the Marrs case. Mr. Marty Jones further requested a copy of his letter be part of the record. To further his point, would be the example of the county in the Panhandle with the Ogallala Aquifer on the north side of the Canadian River is actually and physically separated from the Ogallala Aquifer on the south side of the Canadian River to the extent pumping on the north side cannot affect people on the south side. Mr. Jones noted there are different water districts on the north and south sides, and appropriately so, and there can be different DFCs because the pumping on one side does not affect the other. In tying the Panhandle example back to the Liberty County-Montgomery County example, people in Liberty County who have no rule or regulations on their production can pump water from landowners in Montgomery County, who because of the adopted DFC cannot protect themselves. He concluded that would be the case on every county line a DFC has been established. Mr. Marty Jones urged the GMA to respect the TWDB guidance and the Legislative intent of 36.108, not simply come together and agree on each county boundary DFC, but adopting aquifer-wide DFCs is the only way you truly engage the process and protect private property.

Ms. Jones thanked him for his comments. Since there had been no new DFC options for formal consideration, in accordance to administrative procedures, there was no action to be considered.

Ms. Jones moved to discussion and possible action to approve an eligible DFC option as the proposed DFC as required by Texas Water Code Sections 36.108(d) and (d-2) and in accordance with GMA 14 Administrative Procedures, Section 3.05. She noted that today, according to the administrative procedures adopted by GMA 14, there was one set of DFC options that have now formally been considered according to the requirements set forth in Section 36.108 of the Texas Water Code and therefore the DFC option was now eligible for approval by the GMA as the proposed DFCs, which will then be sent to the individual districts for a 90-day comment period and public hearing. Ms. Jones asked Mr. Mullican if there was anything additional before formal discussion or action on this item. Mr. Mullican noted the information provided regarding the balancing test of the highest practicable level of groundwater production and the conservation, preservation, protection, recharging, and prevention of waste of groundwater and control of subsidence in the management area as documented in Texas Water Code Section 36.108(d-2). While this has been within the discussions previous, he has provided a draft document summarizing these discussions which will continue to be developed throughout development of the explanatory report. He noted that all of the information considered by GMA 14 during the development of proposed DFCs must be disseminated to each district and made available to the public. Mr. Burkett remarked that during the 90-day comment period each district must hold a public hearing. Mr. Martin clarified that there was no requirement when the hearing was held, just within the comment period. Mr. Mullican also referenced the draft timeline document which was introduced at the last meeting and would be updated and provided with the information packet when distributed to the GCDs.

Ms. Jones opened discussion by the GMA 14 members. Mr. Holland noted there may be a request for additional aquifers to be deemed non-relevant for the purposes of joint planning when individual GCDs submit their summary reports at the conclusion of the public comment period. Ms. Jones recognized Mr. Paul Nelson to read a prepared statement into the record on behalf of Mr. Willcox representing Chambers County who was unable to attend the meeting (see Attachment "F" for Willcox letter). Ms. Jones directed discussion to the proposed resolution. Mr. Mullican documented the comments and revisions made to the resolution. Mr. Turco added a statement of appreciation from the Subsidence Districts to the GMA for their work, coordination, and cooperation throughout this process. Ms. Jones then called for a motion to adopt Resolution 2015-01 for the approval of proposed desired future conditions for all relevant aquifers in GMA

14. With the motion made by Mr. Burkett, seconded by Mr. Martin, the motion passed unanimously.

Ms. Jones next asked for a briefing and discussion of progress to date for GMA 14 Joint Planning and remaining requirements. Mr. Mullican was asked for a short timeline of next steps. Mr. Mullican stated the 90 day comment period begins when the information is posted and provided to the GCDs. After the close of the comment period, each GCD must compile comments received and respond to all comments in a summary report. Mr. Ashmore asked about draft timeline and if it only included to-date accomplishments or if it laid out future dates which were needed. Mr. Mullican noted that at this time the draft is only what has been done, but he would revise and document the still-to-come future meetings or action items. Mr. Mullican outlined the process moving forward for the group.

Ms. Jones asked for any presentations and discussions by Districts of recent activities of interest to or impacting the GMA 14 planning group. Ms. Jones documented correspondence received by LSGCD on behalf of GMA 14 (see Attachment "G", correspondence received by LSGCD).

Mr. Jones called for discussion of next meeting date, location, and agenda items. A tentative date of Wednesday October 28, 2015, at 10:00 AM at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303, was proposed and agreed upon with the acknowledgment the date could be changed if necessary for completion of District summaries of comments received during the 90-day period.

Without further discussion or comment and there being no further business, the meeting was adjourned at 11:35 AM.

PASSED, APPROVED, AND ADOPTED THIS 2 day of October

Chairman

ATTEST:

Secretary

For Hall

RESOLUTION FOR THE APPROVAL OF PROPOSED DESIRED FUTURE CONDITIONS FOR ALL AQUIFERS IN GROUNDWATER MANAGEMENT AREA 14

Whereas, pursuant to Section 35.004 of the Texas Water Code, the Texas Water Development Board ("TWDB") has designated groundwater management areas that, together, cover all major and minor aquifers in the state; and

Whereas, each groundwater management area was designated with the objective of providing the most suitable area for the management of groundwater resources; and

Whereas, through Title 31, Section 356.21 of the Texas Administrative Code, the TWDB has designated the area encompassing all of Austin, Brazoria, Chambers, Fort Bend, Galveston, Grimes, Hardin, Harris, Jasper, Jefferson, Liberty, Montgomery, Newton, Orange, Polk, San Jacinto, Tyler, Walker, Waller, and Washington counties as Groundwater Management Area No. 14 ("GMA 14"); and

Whereas, GMA 14 includes all or portions of areas subject to groundwater regulation by Bluebonnet Groundwater Conservation District (Austin, Grimes, Walker, and Waller counties), Brazoria County Groundwater Conservation District (Brazoria County), Lone Star Groundwater Conservation District (Montgomery County), Lower Trinity Groundwater Conservation District (Polk and San Jacinto counties), and Southeast Texas Groundwater Conservation District (Hardin, Jasper, Newton, and Tyler counties) (the "Member Districts"); and

Whereas, the Member Districts are authorized by Chapter 36, Texas Water Code, to engage in joint planning activities for the coordinated management of the aquifers located in GMA 14, and in that regard, shall establish desired future conditions ("DFCs") for the relevant aquifers within GMA 14; and

Whereas Fort Bend Subsidence District (Fort Bend County), Harris-Galveston Subsidence District (Galveston and Harris counties), and other stakeholders within GMA 14 from Chambers County, and Washington County also contributed to the development of DFCs for GMA 14; and

Whereas, Section 36.108 of the Texas Water Code requires the Member Districts in GMA 14 to consider groundwater availability models and other data or information for the management area and vote on a proposal for the adoption of DFCs for each relevant aquifer within GMA 14 by May 1, 2016; and

Whereas, the Member Districts within GMA 14 secured hydrogeologic and engineering consulting services to provide technical support in their efforts to establish requisite DFCs; and

Whereas, in developing the proposed DFCs for the relevant aquifers within GMA 14, the Member Districts in GMA 14 considered the nine statutory factors set forth in Section 36.108(d) of the Texas Water Code:

- aquifer uses or conditions within the management area, including conditions that differ substantially from one geographic area to another,
- the water supply needs and water management strategies included in the state water plan,
- hydrological conditions, including for each aquifer in the management area the total estimated recoverable storage as provided by the executive administrator, and the average annual recharge, inflows, and discharge,
- other environmental impacts, including impacts on spring flow and other interactions between groundwater and surface water,
- the impact on subsidence,
- socioeconomic impacts reasonably expected to occur,
- the impact on the interests and rights in private property, including ownership and the rights of management area landowners and their lessees and assigns in groundwater as recognized under Section 36.002,
- the feasibility of achieving the desired future condition, and
- any other information relevant to the specific desired future conditions; and

Whereas, pursuant to Section 36.108(d-2), the Member Districts also considered in their development of proposed DFCs the balance between the highest practicable level of groundwater production and the conservation, preservation, protection, recharging, and prevention of waste of groundwater and control of subsidence in the management area; and

Whereas, the Member Districts used this information to developed proposed DFCs for the portions of the northern segment of the Gulf Coast Aquifer that occurs within the bounds of GMA 14; and

Whereas, TWDB conducted an evaluation of the Houston Area Groundwater Model ("HAGM") and adopted it as the updated Northern Gulf Coast Groundwater Availability Model ("GAM"); and

Whereas, the Members Districts conducted a model run of the updated Northern Gulf Coast GAM for the purpose of evaluating drawdown in the Northern Gulf Coast Aquifer; and

Whereas, the TWDB has prepared a report for GAM Task 10-052 MAG for the Carrizo-Wilcox Aquifer; and

Whereas, the TWDB has prepared a report for GAM Task 10-053 MAG for the Queen City Aquifer; and

Whereas, the TWDB has prepared a report for GAM Task 10-054 MAG for the Sparta Aquifer; and

Whereas, the TWDB has prepared a report for GAM Task 10-055 MAG for the Yegua-Jackson Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-30 MAG for the Brazos River Alluvium Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-31 MAG for the Navasota River Alluvium Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-32 MAG for the San Bernard River Alluvium Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-33 MAG for the San Jacinto River Alluvium Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-34 MAG for the Trinity River Alluvium Aquifer; and

Whereas, during joint meetings noticed and conducted pursuant to Section 36.108(e) of the Texas Water Code, the Member Districts considered GAMs and other data and information relevant to the development of DFCs for GMA 14, including input and comments from stakeholders within GMA 14; and

Whereas, the Member Districts find that all notice requirements for a meeting, held this day, to take up and consider the approval of the proposed DFCs as described herein for GMA 14 have been, and are, satisfied; and

Whereas, Texas Water Code Section 36.0015(b), as amended by House Bill 200 during the 84th Texas Legislature states that "(b) In order to provide for the conservation, preservation, protection, recharging, and prevention of waste of groundwater, and of groundwater reservoirs or their subdivisions, and to control subsidence caused by withdrawal of water from those groundwater reservoirs or their subdivisions, consistent with the objectives of Section 59, Article XVI, Texas Constitution, groundwater conservation districts may be created as provided by this chapter. Groundwater conservation districts created as provided by this chapter are the state's preferred method of groundwater management in order to protect property rights, balance the conservation and development of groundwater to meet the needs of this state, and use the best available science in the conservation and development of groundwater through rules developed, adopted, and promulgated by a district in accordance with the provisions of this chapter"; and

Whereas, the Member Districts find that the proposed DFCs provided herein for establishment are each merited and necessary for the effective and prudent management of groundwater resources within GMA 14, and have otherwise been developed in accordance with, and do satisfy the obligations imposed by, Chapter 36 of the Texas Water Code and all other applicable laws of the State of Texas.

Now, therefore, be it resolved by the Member Districts of GMA 14 that the following proposed DFCs are each hereby established:

Formations of the Gulf Coast Aquifer

Austin County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 39 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 76 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Austin County should not exceed approximately 2.83 feet by the year 2070.

Brazoria County (BCGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 27 feet after 61 years.

Chambers County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 32 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 30 feet after 61 years.

Grimes County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 5 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 5 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 6 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 52 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Grimes County should not exceed approximately 0.12 feet by the year 2070.

Hardin County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 21 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 27 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 29 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 89 feet after 61 years.

Jasper County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 41 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 46 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 40 feet after 61 years.

Jefferson County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 15 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 17 feet after 61 years.

Liberty County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 27 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 29 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 25 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 120 feet after 61 years.

Montgomery County (LSGCD)

• From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 26 feet after 61 years.

- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately -4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately -4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 34 feet after 61 years.

Newton County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 35 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 45 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 44 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 37 feet after 61 years.

Orange County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 14 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 16 feet after 61 years.

Polk County (LTGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 26 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 10 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 15 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 73 feet after 61 years.

San Jacinto County (LTGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 22 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 19 feet after 61 years.

- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 19 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 108 feet after 61 years.

Tyler County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 42 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 35 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 30 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 62 feet after 61 years.

Walker County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 9 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 42 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Walker County should not exceed approximately 0.04 feet by the year 2070.

Waller County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 39 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 39 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 40 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 101 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Waller County should not exceed approximately 4.73 feet by the year 2070.

Washington County

- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 1 foot after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 16 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 48 feet after 61 years.

Formations in Fort Bend, Galveston, and Harris counties

Groundwater Management Area 14 (GMA 14) efforts to determine DFCs is primarily an aquifer water-level based approach to describe the regional and local desires for the aquifer beneath them. The GMA process requires Groundwater Conservation Districts (GCDs) to determine the DFCs for the entire GMA, regardless of whether each county is included within a GCD. The Fort Bend Subsidence District (FBSD) and the Harris-Galveston Subsidence District (HGSD), operating in Fort Bend County and Harris and Galveston counties, respectively, regulate groundwater for the purpose of ending land surface subsidence within their jurisdiction. They are not GCDs and operate considerably different from the typical GCD. Therefore, in an official context these three counties are "unrepresented" but the GCDs within GMA-14 must still determine the DFC for these counties.

Both FBSD and HGSD have participated in an unofficial role to aid the GCDs within GMA-14 with their evaluation of Fort Bend, Galveston and Harris County information. The groundwater pumpage within these three counties even though regulated is still greater than the sum of all other counties within GMA-14. FBSD and HGSD recognize that the projected groundwater pumpage from these three counties will impact the decisions of GMA-14 throughout a large portion of the area. FBSD and HGSD have provided considerable historical and projected groundwater pumpage data and details of regulations to assist GMA-14 in incorporating these counties in the overall GMA-14 DFCs. FBSD and HGSD cannot however, present DFCs for these three counties in terms of aquifer water-level changes over time. The FBSD and HGSD regulations do not specifically address water-levels nor do they designate a specific pumping limit, rather the regulations are based on limitations of groundwater as a percentage of total water demand. The percentage of groundwater to total water demand is decreased over time, as total water demand increases.

The goal of both FBSD and HGSD is to end land surface subsidence that is caused by man's pumpage of groundwater. There is a clearly established link between the over-pumpage of groundwater and land surface subsidence. The DFCs within the aquifer beneath Fort Bend, Galveston, and Harris counties has no easily defined relationship to water-levels. The DFC for FBSD and HGSD is the reduction and halting of the compaction of clay layers within the aquifer caused by the over-pumpage of groundwater. Stated more simply, the DFC for these three counties is that future land surface subsidence be avoided. That stated, HGSD and FBSD have adopted regulations, most recently in 2013, that require the reduction of

groundwater pumpage and the conversion to alternate water sources, while balancing with the realistic ability of the permittees to achieve compliance with these regulations. This effort was accomplished with the aid of computer models and information specific to the missions of FBSD and HGSD and outside of the revised Northern Gulf Coast GAM (NGCGAM) adopted by the TWDB.

Within HGSD, from central to southeastern Harris County and all of Galveston County (Regulatory Areas 1 and 2), virtually all permittees have achieved compliance with previous and current HGSD regulations. Subsidence has been halted and water-levels within the aquifer have risen dramatically in these areas. However, in northern and western areas of Harris County (Regulatory Area 3), the HGSD regulations have allowed groundwater pumpage to continue until the required reductions in 2010, 2025, and 2035. With these scheduled reductions in groundwater pumpage, subsidence will slow dramatically and even be halted with water-levels stabilizing and in later years rising.

Within FBSD, from central to northern and eastern Fort Bend County (Regulatory Area A), the regulations call for reductions of groundwater pumpage in 2014/2016, and 2025. Similar to HGSD's Regulatory Area 3, subsidence within FBSD Regulatory Area A will slow dramatically and even be halted with water-levels stabilizing and in later years rising.

In both HGSD and FBSD, because of the percentage based approach to regulations, groundwater pumpage will increase until scheduled reductions in milestone years (ex: 2010, 2014/2016, 2025, and 2035). In between milestone years, groundwater pumpage will increase with the assumed increase in total water demand from an assumed increase in population. In order to demonstrate the DFC of these three counties using water-level changes, the area of previous groundwater-to-alternative water conversions must be separated from future conversions AND each annual time step must be depicted.

The HGSD and FBSD have submitted to GMA-14 their current regulations and projected groundwater pumpage projections through the year 2070. This data has been divided into the grid cells/layers relative to the NGCGAM and utilized by the GCDs in development of their DFCs.

Groundwater pumpage within GMA-14 from Fort Bend, Galveston, and Harris counties is regulated by FBSD and HGSD, non GCD governmental agencies (the only GMA in Texas with this occurrence) and the missions of HGSD and FBSD are vastly different from GCDs and do not fit well with a water-level designed DFC process). The groundwater pumpage projections developed in recognition of the HGSD and FBSD regulatory plans have been utilized without adjustment by GMA14 in the DFC process. Therefore, the DFCs adopted by GMA-14 are consistent with the HGSD and FBSD regulatory plans.

Carrizo Sand Aquifer

Grimes County (BGCD)

From estimated 2010 conditions, the average drawdown of the Carrizo Sand Aquifer should not
exceed approximately 52.8 feet average draw down across the area of occurrence of the aquifer.

Walker County (BGCD)

From estimated 2010 conditions, the average drawdown of the Carrizo Sand Aquifer should not
exceed approximately 45.7 feet average draw down across the area of occurrence of the aquifer.

Queen City Aquifer

Grimes County (BGCD)

 From estimated 2010 conditions, the average drawdown of the Queen City Aquifer should not exceed approximately 16.8 feet average draw down across the area of occurrence of the aquifer.

Walker County (BGCD)

• From estimated 2010 conditions, the average drawdown of the Queen City Aquifer should not exceed approximately 21.0 feet average draw down across the area of occurrence of the aquifer.

Sparta Aquifer

Grimes County (BGCD)

• From estimated 2010 conditions, the average drawdown of the Sparta Aquifer should not exceed approximately 14 feet average draw down across the area of occurrence of the aquifer.

Walker County (BGCD)

• From estimated 2010 conditions, the average drawdown of the Sparta Aquifer should not exceed approximately 19.5 feet average draw down across the area of occurrence of the aquifer.

Yegua-Jackson Aquifer

Grimes County (BGCD)

- From estimated 2010 conditions, the average drawdown of the unconfined portion of the Yegua should not exceed approximately 10 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the confined portion of the Yegua should not exceed approximately 15 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the brackish confined portion of the Yegua should not exceed approximately 20 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the unconfined portion of the Jackson should not exceed approximately 10 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the confined portion of the Jackson should not exceed approximately 15 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the brackish confined portion of the
 Jackson should not exceed approximately 20 feet average draw down across the area of
 occurrence of the aquifer.

Jasper County (STGCD)

The portion of the Yegua-Jackson occurring in Jasper County is declared non-relevant.

Newton County (STGCD)

The portion of the Yegua-Jackson occurring in Newton County is declared non-relevant.

Polk County (LTGCD)

The portion of the Yegua-Jackson occurring in Polk County is declared non-relevant.

Tyler County (STGCD)

The portion of the Yegua-Jackson occurring in Tyler County is declared non-relevant.

Walker County (BGCD)

- From estimated 2010 conditions, the average drawdown of the unconfined portion of the Yegua should not exceed approximately 10 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the confined portion of the Yegua should not exceed approximately 15 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the brackish confined portion of the Yegua should not exceed approximately 20 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the unconfined portion of the Jackson should not exceed approximately 10 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the confined portion of the Jackson should not exceed approximately 15 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the brackish confined portion of the Jackson should not exceed approximately 20 feet average draw down across the area of occurrence of the aquifer.

Washington County

• From estimated 2010 conditions, no additional drawdown of the Yegua Jackson across the area of occurrence of the aquifer.

River Alluvium Aquifers

Austin County (BGCD)

- The portion of the Brazos River Alluvium occurring in Austin County is declared non-relevant.
- The portion of the San Bernard River Alluvium occurring in Austin County is declared non-relevant.

Grimes County (BGCD)

- The portion of the Brazos River Alluvium occurring in Grimes County is declared non-relevant.
- The portion of the Navasota River Alluvium occurring in Grimes County is declared non-relevant.

Walker County (BGCD)

- The portion of the San Jacinto River Alluvium occurring in Walker County is declared non-relevant.
- The portion of the Trinity River Alluvium occurring in Walker County is declared non-relevant.

Waller County (BGCD)

• The portion of the Brazos River Alluvium occurring in Walker County is declared non-relevant.

Washington County

• The portion of the Brazos River Alluvium occurring in Washington County is declared non-relevant.

Groundwater Management Area 14

Mr. John Martin

Resolution No. 2015-01

And it is so ordered and passed this XX day of XXX, 2015.

Southeast Texas Groundwater Conservation District

UPPER GULF COAST AQUIFER PLANNING AREA (GMA 14)

Joint Planning Group Meeting

Wednesday, October 28, 2015 10:00 AM

MEETING MINUTES

A regular meeting of GMA 14 was held Wednesday, October 28, 2015, at 10:00 AM, in the board room of the Lone Star Groundwater Conservation District located at 655 Conroe Park North Drive, Conroe, Texas.

The meeting was called to order by Kathy Turner Jones (Lone Star GCD) at 10:02 AM with a roll call of District representatives and Interlocal Agreement Participants. Districts represented included: Kent Burkett, Brazoria County GCD, Zach Holland, Bluebonnet GCD, Kathy Turner Jones, Lone Star GCD, Gary Ashmore, Lower Trinity GCD and John Martin, Southeast Texas GCD. Interlocal Agreement Participants included: The Honorable John Brieden, Washington County Judge; Robert Thompson, Fort Bend Subsidence District; and Mike Turco, Harris-Galveston Subsidence District. Also in attendance at the meeting were: Jason Afinowicz, Freese and Nichols, Inc.; Natalie Ballew, GMA 14 Liaison with Texas Water Development Board (TWDB); Bill Mullican, Mullican and Associates; and members of the public (see <u>Attachment</u> "A" for a list of attendees).

Ms. Jones welcomed everyone to the meeting and recognized District, Interlocal Agreement Participants, Agency, staff, and consultants for introduction.

Ms. Jones called for and opened the floor to public comment. Mr. Marty Jones filled out a card and wished to reserve his comments for the agenda item where Bluebonnet GCD's revisions would be discussed.

Ms. Jones proceeded with receipt and requests of posted notices from the group. Ms. Jones then asked for consideration of the approval of the minutes from the GMA 14 meeting on June 24, 2015. After discussion and upon a motion by Mr. Burkett, seconded by Mr. Martin the minutes for the June 24, 2015 meeting were approved unanimously.

Meeting convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

The GMA 14 Joint Planning Interlocal Agreement Participants meeting was called to order at 10:06 AM.

Ms. Jones next recognized Ms. Ballew for a presentation of information from the TWDB and discussions of items of interest to the GMA. Ms. Ballew noted the two stakeholder comment opportunities are currently in progress at the TWDB stemming from recent legislation. Ms. Ballew also noted that each district should have received exempt use estimates for their district. The TWDB has also rolled out a new groundwater viewer, *Water Data Interactive*, now available through their website. Finally, Mr. Ballew noted the availability of a new submitted driller's report database.

Ms. Jones called for the discussion of funding levels, participation and any other aspects for the Interlocal Agreement Participants and take possible action. Ms. Jones gave the floor to Mr. Burkett who reviewed and outlined the financials provided.

Ms. Jones called for the presentation and discussion of summary reports submitted by each groundwater conservation district (District) in GMA 14 and any Districts' suggested revisions to the proposed desired future conditions, as required by Texas Water Code Section 36.108 (d-2), and any additional information that District Representatives may provide in response to comments received or revisions suggested. Ms. Jones noted at the last joint planning meeting the member District Representatives voted to approve the proposed DFCs, and those proposed DFCs were subsequently distributed to the individual Districts in the management area, A period of not less than 90 days was provided to allow for public comments on the proposed DFCs, and during this comment period each District held a public hearing on the proposed DFCs. After the public hearing, each District was required to compile for consideration at today's meeting a summary report of the relevant comments received, any suggested revisions to the proposed DFCs, and the basis for the revisions pursuant to Texas Water Code Section 36.108 (d-2). Ms. Jones noted each District representative would be called on to present their District's summary report and any alternative DFCs or revisions that their board had requested. Ms. Jones stated that the agenda was not set up to allow public comment on the summary reports, however, Mr. Marty Jones was recognized to provide his previously reserved comments. Mr. Marty Jones noted the proposed changes tendered by Bluebonnet GCD. He was observing how such proposals would be handled through the process, specifically if a comment period would be provided.

Mr. Martin, General Manager for the Southeast Texas GCD, provided the District's summary report with proposed language changes approved by the board (see <u>Attachment "B" for SETGCD Summary Report</u>).

Mr. Ashmore, General Manager for the Lower Trinity GCD called on Mr. Greg Ellis, District's counsel, to provide the District's summary report. Mr. Ellis provided the District's statement

with proposed non-substantive language changes approved by the board regarding the articulation of the DFCs to the resolution (see <u>Attachment "C" for LTGCD Summary Report</u>).

Mr. Burkett, General Manager for the Brazoria County GCD, also called on Mr. Greg Ellis, District's counsel, to provide the District's summary report. Mr. Ellis provided the District's statement with proposed non-substantive language changes approved by the board regarding the articulation of the DFCs to the resolution (see <u>Attachment "D" for BCGCD Summary Report</u>).

Mr. Holland, General Manager of the Bluebonnet GCD next provided the District's statement with proposed non-substantive language changes approved by the board (see <u>Attachment "E" for BGCD Summary Report</u>). Proposed changes to the resolution were to the articulation of the DFCs and specific notation and citing of the model run utilized by the GMA. Mr. Holland noted the requirement for a draft explanatory report to be compiled prior to formal approval of the DFCs.

Ms. Jones, General Manager of Lone Star GCD then called on Mr. Mullican to provide the District's summary report and any alternative DFCs or revisions that their board had requested. Mr. Mullican provided the District's statement approved by the board (see <u>Attachment "F" for LSGCD Summary Report</u>).

Ms. Jones called for a discussion and consideration of any additional or supplemental information or criteria relative to the proposed DFCs for inclusion in the explanatory report. Following the presentation and review of all member Districts' summary reports and suggested revisions, Ms. Jones asked if there was any additional information that would be requested to be placed into consideration based on the comments received. Mr. Martin, Mr. Ashmore, and Mr. Burkett noted nothing further for addition from their Districts. Mr. Holland reiterated the non-substantive language addition of aquifer-wide DFC articulation to the existing resolution, the reference and citation of the specific model run, and the importance of a draft explanatory report prior to final adoption of the DFCs. Ms. Jones noted nothing further for addition from LSGCD.

Ms. Jones adjourned the meeting of the GMA 14 Interlocal Agreement Participants and reconvening the Joint Planning Group meeting at 10:43 AM.

Ms. Jones reconvened the GMA 14 meeting and called for the discussion, consideration, and possible action of suggested revisions to proposed DFCs or alternate DFCs included in the submitted summary reports. Ms. Jones recognized Mr. Mullican for additional comments. Mr. Mullican went through a redline version of the resolution to highlight the requested changes previously discussed in the summary reports by the District members. Mr. Mullican noted in response to Bluebonnet GCD request for a model write up that Freese and Nichols, Inc. had completed that in a June 2014 memo which will be included in the explanatory report. Mr. Mullican noted this reference to the redline version of the resolution. The aquifer-wide DFC articulation language from Brazoria County GCD and Lower Trinity GCD, with Bluebonnet GCD revisions, was noted as a non-substantive change. Mr. Mullican referenced material from

GAM Run 10-023 documenting similar statistical presentation of aquifer-wide with county-by-county language from the previous DFC planning cycle. Mr. Mullican noted Bluebonnet GCD revisions to the designation of Carrizo Sand, Sparta, Queen City, and Yegua-Jackson Aquifers in Grimes and Walker Counties as not relevant for the purposes of joint planning.

Ms. Jones called for a discussion, consideration, possible action of final adoption of DFCs and timing and development of the explanatory report. Ms. Jones recognized Mr. Mullican to begin discussions. Mr. Mullican gave his interpretation of statute regarding the explanatory report. Based on nature of the project, the explanatory report cannot be compiled until the DFC statements have more finality to pull all the pieces of the explanatory report together. Mr. Mullican noted the cornerstone to the explanatory report is the balancing test document which had been distributed prior to 90-day comment period. Assuming some finality to the DFC statement, Mr. Mullican proposed his intent to produce a draft explanatory report in 30 days, have a couple weeks for comments, and come back with comment document to accompany the draft for the group's benefit to see what revisions were made and why others were not made by consultants. The group would then be able to finalize the DFCs and the submission of the explanatory report. Mr. Mullican noted there were no statutory timelines regarding the explanatory report, though there are in TWDB rules as noted by Mr. Holland, Mr. Burkett made a motion to approve the statement of the DFCs as set forth in the resolution as amended October 28, 2015 for purposes of drafting the explanatory report. No additional comments shall be considered or revisions made to the statement of the DFCs. Once the draft explanatory report is complete, the GMA shall consider the information in the draft report and take action to formally adopt the statement of the DFCs. The motion was seconded by Mr. Martin. Upon further discussion and clarity of the motion by the group, Ms. Jones called for a roll call vote by the member Districts. Each member District, Mr. Burkett, Brazoria County GCD, Mr. Holland. Bluebonnet GCD, Ms. Jones, Lone Star GCD, Mr. Ashmore, Lower Trinity GCD and Mr. Martin, Southeast Texas GCD voted in favor of the motion.

Ms. Jones next asked for a briefing and discussion of progress to date for GMA 14 Joint Planning and remaining requirements. Mr. Mullican was asked for a short timeline of next steps. Mr. Mullican stated he would begin pulling together the draft explanatory report of the administrative record established, comments received, and GMA input. Mr. Mullican indicated early January should be a target for wrapping up.

Ms. Jones asked for any presentations and discussions by Districts of recent activities of interest to or impacting the GMA 14 planning group. Ms. Jones noted the lawsuit filed against LSGCD.

Mr. Jones called for discussion of next meeting date, location, and agenda items. With the next meeting contingent on completion and comment on the draft explanatory report, Mr. Mullican recommended an early January date to be held at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303. Noted in discussion was the timing of holidays and the possibility of District board action needed, a poll

for available January or February meeting dates would be sent to the group. No tentative date was set.

Without further discussion or comment and there being no further business, the meeting was adjourned at 11:24 AM.

PASSED, APPROVED, AND ADOPTED THIS day of

UPPER GULF COAST AQUIFER PLANNING AREA (GMA 14)

Joint Planning Group Meeting

Friday, April 29, 2016 9:00 AM

MEETING MINUTES

A regular meeting of Groundwater Management Area 14 (GMA 14) was held Friday, April 29, 2016, at 9:00 a.m., in the board room of the Lone Star Groundwater Conservation District (Lone Star GCD) located at 655 Conroe Park North Drive, Conroe, Texas.

The meeting was called to order by Kathy Turner Jones, Lone Star GCD) at 9:03 a.m. with a roll call of District Representatives and Interlocal Agreement Participants. Districts represented included: Kent Burkett, Brazoria County GCD; Zach Holland, Bluebonnet GCD; Kathy Turner Jones, Lone Star GCD; Gary Ashmore, Lower Trinity GCD; and John Martin, Southeast Texas GCD. Interlocal Agreement Participants included: The Honorable John Brieden, Washington County Judge (who arrived at 9:12 a.m.); Pudge Willcox, Chambers County; Robert Thompson, Fort Bend Subsidence District; and Mike Turco, Harris-Galveston Subsidence District. Also in attendance at the meeting were: Jason Afinowicz, Freese and Nichols, Inc.; Larry French, Texas Water Development Board (TWDB); Bill Mullican, Mullican and Associates; and members of the public (see Attachment "A" for a list of attendees).

Ms. Jones recognized the TWDB's Larry French, Division Director for the Groundwater Resources Division, for being in attendance. She then welcomed everyone to the meeting, asking District Representatives, Interlocal Agreement Participants, Agency Representatives, staff, and consultants for introduction.

Ms. Jones opened the meeting for public comment. No one sought to provide public comment.

Ms. Jones proceeded with receipt and requests of posted notices from the group.

Ms. Jones then asked for consideration of the approval of the minutes from the GMA 14 meeting held on October 28, 2015. A motion to approve the minutes was made by Kent Burkett and seconded by John Martin. The motion carried unanimously.

Meeting convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

Led by a presentation by Mr. Burkett, the GMA 14 Joint Planning Interlocal Agreement Participants discussed possible action regarding amendments to Work Order No. 3 for joint-

planning activities as established during current round of joint planning as well as amendments to the budget for GMA 14 Interlocal Agreement participants that may be necessary or required. Mr. Burkett reviewed a one-page summary of GMA 14 financials. Furthermore, if accepted, Mr. Burkett stated that Mr. Mullican's services, specific to Work Order No. 3, would no longer be required and Mr. Afinowicz's services, specific to Work Order No. 3, would only be minimally required going forward. Judge Brieden asked for additional clarification. Mr. Afinowicz explained that, hypothetically, and with no major changes, he did not anticipate any additional cost. Mr. Martin suggested the representatives approve the item and revaluate going forward. A motion to approve the budget amendments as presented by Mr. Burkett for Mullican and Associates and Freese and Nichols, Inc. was made by Michael Turco, and the motion was seconded by Kent Burkett. The motion carried unanimously.

The GMA 14 Joint Planning Interlocal Agreement Participants meeting was adjourned at 9:20 a.m.

Meeting reconvened as a meeting of the GMA 14 District Representatives only.

The GMA 14 District Representatives discussed possible action to adopt the Desired Future Conditions for the relevant aquifers in GMA 14 by resolution as required by Section 36.108(d-3) of the Texas Water Code. Mr. Mullican explained that, compared to the October 28, 2015 resolution, the current resolution under consideration is nearly identical. The only minor exception, he explained, being that the Yegua-Jackson Aquifer in Washington County was added to the list of non-relevant aquifers in the resolution. A motion to adopt the Resolution for the Approval of the Desired Future Conditions for all Aquifers in Groundwater Management Area 14 was made by Kent Burkett, and the motion was seconded by Gary Ashmore. Zach Holland abstained. The motion carried by a two-thirds vote of approval by the District Representatives as required by Section 36.108(d-3) of the Texas Water Code.

The GMA 14 District Representatives discussed possible action authorizing the GMA 14 Chair and the contracted consultant, on behalf of the GMA 14 District Representatives, to submit the explanatory report and all other required documentation regarding submission of adopted Desired Future Conditions to the Texas Water Development Board and authorizing the GMA 14 Chair to make any minor, technical, or grammatical changes consistent with the DFCs adopted prior to submission. Mr. Mullican explained that there are four minor items remaining before the report may be officially completed: filling in appropriate dates throughout explanatory report; accepting all revisions that have been made since the April 3rd draft of the explanatory report; populating Appendix A, regarding TWDB's checklist; and affixing Jason Afinowicz's professional engineer seal to the report and affixing Bill Mullican's professional geoscientist seal. Before voting on a motion, Mr. Martin expressed his gratitude to the many who had been involved and their collaborative efforts in preparing the final version of the explanatory report. Ms. Jones echoed his sentiment, adding that it has become a great product. Also before voting on a motion, Mr. Holland, to Mr. Mullican, asked why the explanatory report had not already

been finalized to a state where it could be submitted by 5 p.m. the same day, April 29, 2016. Mr. Mullican explained that neither he nor Mr. Afinowicz had their official seals with them. Moreover, Mr. Mullican emphasized that, regarding Appendix A, he did not want to rush any potential changes within an hour's time. He projected the report would be ready next week.

A motion to authorize the GMA 14 Chair to work with the contracted consultant to make the final edits to the Explanatory Report as discussed at the meeting and submit the report to the TWDB as required by Section 36.108(d-3) of the Texas Water Code was made by John Martin, and the motion was seconded by Kent Burkett. Zach Holland abstained. The motion carried.

Without further discussion or comment and there being no further business, the meeting was adjourned at 9:32 a.m.

PASSED, APPROVED, AND ADOPTED THIS 29 day of April 7016

Chairman

ATTEST:

Secretary

Fort Del-1

RESOLUTION FOR THE APPROVAL OF DESIRED FUTURE CONDITIONS FOR ALL AQUIFERS IN GROUNDWATER MANAGEMENT AREA 14

Whereas, pursuant to Section 35.004 of the Texas Water Code, the Texas Water Development Board ("TWDB") has designated groundwater management areas that, together, cover all major and minor aquifers in the state; and

Whereas, each groundwater management area was designated with the objective of providing the most suitable area for the management of groundwater resources; and

Whereas, through Title 31, Section 356.21 of the Texas Administrative Code, the TWDB has designated the area encompassing all of Austin, Brazoria, Chambers, Fort Bend, Galveston, Grimes, Hardin, Harris, Jasper, Jefferson, Liberty, Montgomery, Newton, Orange, Polk, San Jacinto, Tyler, Walker, Waller, and Washington counties as Groundwater Management Area No. 14 ("GMA 14"); and

Whereas, GMA 14 includes all or portions of areas subject to groundwater regulation by Bluebonnet Groundwater Conservation District (Austin, Grimes, Walker, and Waller counties), Brazoria County Groundwater Conservation District (Brazoria County), Lone Star Groundwater Conservation District (Montgomery County), Lower Trinity Groundwater Conservation District (Polk and San Jacinto counties), and Southeast Texas Groundwater Conservation District (Hardin, Jasper, Newton, and Tyler counties) (the "Member Districts"); and

Whereas, the Member Districts are authorized by Chapter 36, Texas Water Code, to engage in joint planning activities for the coordinated management of the aquifers located in GMA 14, and in that regard, shall establish desired future conditions ("DFCs") for the relevant aquifers within GMA 14; and

Whereas Fort Bend Subsidence District (Fort Bend County), Harris-Galveston Subsidence District (Galveston and Harris counties), and other stakeholders within GMA 14 from Chambers County, and Washington County also contributed to the development of DFCs for GMA 14; and

Whereas, Section 36.108 of the Texas Water Code requires the Member Districts in GMA 14 to consider groundwater availability models and other data or information for the management area and vote on a proposal for the adoption of DFCs for each relevant aquifer within GMA 14 by May 1, 2016; and

Whereas, the Member Districts within GMA 14 secured hydrogeologic and engineering consulting services to provide technical support in their efforts to establish requisite DFCs; and

Whereas, in developing the proposed DFCs for the relevant aquifers within GMA 14, the Member Districts in GMA 14 considered the nine statutory factors set forth in Section 36.108(d) of the Texas Water Code:

- aquifer uses or conditions within the management area, including conditions that differ substantially from one geographic area to another,
- the water supply needs and water management strategies included in the state water plan,
- hydrological conditions, including for each aquifer in the management area the total estimated recoverable storage as provided by the executive administrator, and the average annual recharge, inflows, and discharge,
- other environmental impacts, including impacts on spring flow and other interactions between groundwater and surface water,
- the impact on subsidence,
- socioeconomic impacts reasonably expected to occur,
- the impact on the interests and rights in private property, including ownership and the rights of management area landowners and their lessees and assigns in groundwater as recognized under Section 36.002,
- the feasibility of achieving the desired future condition, and
- any other information relevant to the specific desired future conditions; and

Whereas, pursuant to Section 36.108(d-2), the Member Districts also considered in their development of proposed DFCs the balance between the highest practicable level of groundwater production and the conservation, preservation, protection, recharging, and prevention of waste of groundwater and control of subsidence in the management area; and

Whereas, the Member Districts used this information to developed proposed DFCs for the portions of the northern segment of the Gulf Coast Aquifer that occurs within the bounds of GMA 14; and

Whereas, TWDB conducted an evaluation of the Houston Area Groundwater Model ("HAGM") and adopted it as the updated Northern Gulf Coast Groundwater Availability Model ("GAM"); and

Whereas, the Members Districts conducted a model run of the updated Northern Gulf Coast GAM specifically identified as GAM Run 2 for the purpose of evaluating drawdown in the Northern Gulf Coast Aquifer; and

Whereas, the TWDB has prepared a report for GAM Task 10-052 MAG for the Carrizo-Wilcox Aquifer; and

Whereas, the TWDB has prepared a report for GAM Task 10-053 MAG for the Queen City Aquifer; and

Whereas, the TWDB has prepared a report for GAM Task 10-054 MAG for the Sparta Aquifer; and

Whereas, the TWDB has prepared a report for GAM Task 10-055 MAG for the Yegua-Jackson Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-30 MAG for the Brazos River Alluvium Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-31 MAG for the Navasota River Alluvium Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-32 MAG for the San Bernard River Alluvium Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-33 MAG for the San Jacinto River Alluvium Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-34 MAG for the Trinity River Alluvium Aquifer; and

Whereas, during joint meetings noticed and conducted pursuant to Section 36.108(e) of the Texas Water Code, the Member Districts considered GAMs and other data and information relevant to the development of DFCs for GMA 14, including input and comments from stakeholders within GMA 14; and

Whereas, the Member Districts find that all notice requirements for a meeting, held this day, to take up and consider the approval of the proposed DFCs as described herein for GMA 14 have been, and are, satisfied; and

Whereas, Texas Water Code Section 36.0015(b), as amended by House Bill 200 during the 84th Texas Legislature states that "(b) In order to provide for the conservation, preservation, protection, recharging, and prevention of waste of groundwater, and of groundwater reservoirs or their subdivisions, and to control subsidence caused by withdrawal of water from those groundwater reservoirs or their subdivisions, consistent with the objectives of Section 59, Article XVI, Texas Constitution, groundwater conservation districts may be created as provided by this chapter. Groundwater conservation districts created as provided by this chapter are the state's preferred method of groundwater management in order to protect property rights, balance the conservation and development of groundwater to meet the needs of this state, and use the best available science in the conservation and development of groundwater through rules developed, adopted, and promulgated by a district in accordance with the provisions of this chapter"; and

Whereas, the Member Districts find that the proposed DFCs provided herein for establishment are each merited and necessary for the effective and prudent management of groundwater resources within GMA 14, and have otherwise been developed in accordance with, and do satisfy the obligations imposed by, Chapter 36 of the Texas Water Code and all other applicable laws of the State of Texas.

Now, therefore, be it resolved by the Member Districts of GMA 14 that the following DFCs are each hereby established:

Formations of the Gulf Coast Aquifer

DFCs for the Gulf Coast Aquifer are hereby adopted, as documented by and incorporating herein GAM Run 2, at two scales, which do not differ substantively in their application; the first being for GMA 14 in its entirety, and also, to better facilitate the management and conservation of groundwater resources at the individual groundwater conservation district level after considering the statutory criteria set forth under Section 36.108(d), Water Code, on a county-by-county basis. DFCs for GMA 14 for the Gulf Coast Aquifer are as follows:

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 28.3 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 23.6 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 18.5 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 66.2 feet after 61 years.

Austin County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 39 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 76 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Austin County should not exceed approximately 2.83 feet by the year 2070.

Brazoria County (BCGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 27 feet after 61 years.

Chambers County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 32 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 30 feet after 61 years.

Grimes County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 5 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 5 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 6 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 52 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Grimes County should not exceed approximately 0.12 feet by the year 2070.

Hardin County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 21 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 27 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 29 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 89 feet after 61 years.

Jasper County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 41 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 46 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 40 feet after 61 years.

Jefferson County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 15 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 17 feet after 61 years.

Liberty County

• From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 27 feet after 61 years.

- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 29 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 25 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 120 feet after 61 years.

Montgomery County (LSGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 26 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately -4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately -4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 34 feet after 61 years.

Newton County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 35 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 45 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 44 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 37 feet after 61 years.

Orange County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 14 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 16 feet after 61 years.

Polk County (LTGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 26 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 10 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 15 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 73 feet after 61 years.

San Jacinto County (LTGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 22 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 19 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 19 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 108 feet after 61 years.

Tyler County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 42 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 35 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 30 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 62 feet after 61 years.

Walker County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 9 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 42 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Walker County should not exceed approximately 0.04 feet by the year 2070.

Waller County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 39 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 39 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 40 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 101 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Waller County should not exceed approximately 4.73 feet by the year 2070.

Washington County

- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 1 foot after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 16 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 48 feet after 61 years.

Formations in Fort Bend, Galveston, and Harris counties

Groundwater Management Area 14 (GMA 14) efforts to determine DFCs is primarily an aquifer water-level based approach to describe the regional and local desires for the aquifer beneath them. The GMA process requires Groundwater Conservation Districts (GCDs) to determine the DFCs for the entire GMA, regardless of whether each county is included within a GCD. The Fort Bend Subsidence District (FBSD) and the Harris-Galveston Subsidence District (HGSD), operating in Fort Bend County and Harris and Galveston counties, respectively, regulate groundwater for the purpose of ending land surface subsidence within their jurisdiction. They are not GCDs and operate considerably different from the typical GCD. Therefore, in an official context these three counties are "unrepresented" but the GCDs within GMA-14 must still determine the DFC for these counties.

Both FBSD and HGSD have participated in an unofficial role to aid the GCDs within GMA-14 with their evaluation of Fort Bend, Galveston and Harris County information. The groundwater pumpage within these three counties even though regulated is still greater than the sum of all other counties within GMA-14. FBSD and HGSD recognize that the projected groundwater pumpage from these three counties will impact the decisions of GMA-14 throughout a large portion of the area. FBSD and HGSD have provided considerable historical and projected groundwater pumpage data and details of regulations to assist GMA-14 in incorporating these counties in the overall GMA-14 DFCs. FBSD and HGSD cannot however, present DFCs for these three counties in terms of aquifer water-level changes over time. The FBSD and HGSD regulations do not specifically address water-levels nor do they designate a specific pumping limit, rather the regulations are based on limitations of groundwater as a percentage of total water demand. The percentage of groundwater to total water demand is decreased over time, as total water demand increases.

The goal of both FBSD and HGSD is to end land surface subsidence that is caused by man's pumpage of groundwater. There is a clearly established link between the over-pumpage of groundwater and land surface subsidence. The DFCs within the aquifer beneath Fort Bend, Galveston, and Harris counties has no easily defined relationship to water-levels. The DFC for FBSD and HGSD is the reduction and halting of the compaction of clay layers within the aquifer caused by the over-pumpage of groundwater. Stated more simply, the DFC for these three counties is that future land surface subsidence be avoided. That stated, HGSD and FBSD have adopted regulations, most recently in 2013, that require the reduction of

groundwater pumpage and the conversion to alternate water sources, while balancing with the realistic ability of the permittees to achieve compliance with these regulations. This effort was accomplished with the aid of computer models and information specific to the missions of FBSD and HGSD and outside of the revised Northern Gulf Coast GAM (NGCGAM) adopted by the TWDB.

Within HGSD, from central to southeastern Harris County and all of Galveston County (Regulatory Areas 1 and 2), virtually all permittees have achieved compliance with previous and current HGSD regulations. Subsidence has been halted and water-levels within the aquifer have risen dramatically in these areas. However, in northern and western areas of Harris County (Regulatory Area 3), the HGSD regulations have allowed groundwater pumpage to continue until the required reductions in 2010, 2025, and 2035. With these scheduled reductions in groundwater pumpage, subsidence will slow dramatically and even be halted with water-levels stabilizing and in later years rising.

Within FBSD, from central to northern and eastern Fort Bend County (Regulatory Area A), the regulations call for reductions of groundwater pumpage in 2014/2016, and 2025. Similar to HGSD's Regulatory Area 3, subsidence within FBSD Regulatory Area A will slow dramatically and even be halted with water-levels stabilizing and in later years rising.

In both HGSD and FBSD, because of the percentage based approach to regulations, groundwater pumpage will increase until scheduled reductions in milestone years (ex: 2010, 2014/2016, 2025, and 2035). In between milestone years, groundwater pumpage will increase with the assumed increase in total water demand from an assumed increase in population. In order to demonstrate the DFC of these three counties using water-level changes, the area of previous groundwater-to-alternative water conversions must be separated from future conversions AND each annual time step must be depicted.

The HGSD and FBSD have submitted to GMA-14 their current regulations and projected groundwater pumpage projections through the year 2070. This data has been divided into the grid cells/layers relative to the NGCGAM and utilized by the GCDs in development of their DFCs.

Groundwater pumpage within GMA-14 from Fort Bend, Galveston, and Harris counties is regulated by FBSD and HGSD, non GCD governmental agencies (the only GMA in Texas with this occurrence) and the missions of HGSD and FBSD are vastly different from GCDs and do not fit well with a water-level designed DFC process). The groundwater pumpage projections developed in recognition of the HGSD and FBSD regulatory plans have been utilized without adjustment by GMA14 in the DFC process. Therefore, the DFCs adopted by GMA-14 are consistent with the HGSD and FBSD regulatory plans.

Carrizo Sand Aquifer

Grimes County (BGCD)

• The portion of the Carrizo Sand Aquifer occurring in Grimes County is declared non-relevant.

Walker County (BGCD)

• The portion of the Carrizo Sand Aquifer occurring in Walker County is declared non-relevant.

GROUNDWATER MANAGEMENT AREA 14 JOINT PLANNING COMMITTEE **MEETING**

NOTICE OF OPEN MEETING

As required by Section 36.108(e), Texas Water Code, a meeting of the Groundwater Management Area 14 Joint Planning Committee, comprised of representatives from the following groundwater conservation districts located wholly or partially within Groundwater Management Area 14: Bluebonnet GCD, Brazoria County GCD, Brazos Valley GCD, Lone Star GCD, Lower Trinity GCD, and Southeast Texas GCD will be held on Wednesday, September 18, 2013, at 9:00 am at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303.

At this meeting, the following business may be considered and recommended for Joint Planning Committee possible action:

1. Call to order

2. Welcome and Introductions

3. Public Comment

(Public comment is limited to a maximum of 5 minutes per speaker and/or 30 minutes total for all speakers)

4. Receipt of Posted Notices

- 5. Discussion and possible action to approve minutes of June 26, 2013 GMA 14 Joint Planning Meeting.
- 6. Presentation of information from the Texas Water Development Board and discussion of items of interest to the GMA
- 7. Presentation and Discussion by Districts of recent activities of interest to or impacting the GMA 14 planning group.

Meeting will be convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

8. Discuss funding levels, participation, and any other aspects of the Interlocal Agreement and take possible action(s).

9. Briefing and consideration of updated GAM Run using pumping scenarios developed for GAM Run 10-023 and for the updated Northern Gulf Coast GAM. 10. Briefing and consideration of the impacts of proposed Desired Future Conditions on aquifer uses or conditions, including conditions that differ substantially from one geographic area to another in Ground Water Management Area 14 (as required by Texas Water Code 36.108 (d)(1). 11. Briefing and consideration of the impacts of proposed Desired Future Conditions on water supply needs and water management strategies included in the 2012 Texas State Water Plan for Groundwater Management Area 14 (as required by Texas Water Code 36.108 (d)(2).

GMA 14 Interlocal Agreement Participants meeting will be adjourned

- 12. Discussion of new legislation/statutes/rules affecting districts
- 13. Discussion of next meeting date, location, and agenda items.

14. Adjourn

GMA 14 Planning Group Page | 2 09/18/13 Agenda

Further information, questions, or comments concerning any aspect of this meeting should be directed to Mr. Paul R. Nelson of Lone Star Groundwater Conservation District, 655 Conroe Park North Drive, Conroe, TX 77303; pnelson@lonestargcd.org, or (936) 494-3436.

or (930) 494-3430.

GROUNDWATER MANAGEMENT AREA 14 JOINT PLANNING

COMMITTEE MEETING

NOTICE OF OPEN MEETING

As required by Section 36.108(e), Texas Water Code, a meeting of the Groundwater Management Area 14 Joint Planning Committee, comprised of representatives from the following groundwater conservation districts located wholly or partially within Groundwater Management Area 14: Bluebonnet GCD, Brazoria County GCD, Lone Star GCD, Lower Trinity GCD, and Southeast Texas GCD will be held on Wednesday, April 30, 2014, at 9:00 am at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303.

At this meeting, the following business may be considered and recommended for Joint Planning Committee possible action:

- 1. Call to order
- 2. Welcome and Introductions
- 3. Public Comment

(Public comment is limited to a maximum of 5 minutes per speaker and/or 30 minutes total for all speakers)

- 4. Receipt of Posted Notices
- 5. Discussion and possible action to approve minutes of September 18, 2013 GMA 14 Joint Planning Meeting.

Meeting will be convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

- 6. Presentation of information from the U.S. Geological Survey on the approach, conceptual model, model development, model calibration, and review process for the Houston Area Groundwater Model.
- 7. Presentation of information from the Texas Water Development Board and discussion of items of interest to GMA 14 including status of review of Houston Area Groundwater Model.
- 8. Briefing and discussion of approach and results from the predictive simulation utilizing GMA 14 approved pumping amounts in the Houston Area Groundwater Model.
- 9. Discussion and consideration of any possible actions deemed necessary by GMA 14 Joint Planning Interlocal Agreement Participants regarding results from Houston Area Groundwater Model
- 10. Briefing and consideration of draft statement of Desired Future Conditions based on execution of the updated Northern Gulf Coast Aquifer GAM (also referred to as the HAGM).
- 11. Briefing and discussion of process for GMA 14 agreement for proposed Desired Future Conditions during joint-planning process.
- 12. Discuss funding levels, participation, and any other aspects of the Interlocal Agreement and take possible action.
- 13. Presentation and discussion by Districts of recent activities of interest to or impacting the GMA 14 planning group.
- GMA 14 Interlocal Agreement Participants meeting will be adjourned
- 14. Review of progress to date for Groundwater Management Area 14 Joint Planning.
- 15. Discussion of next meeting date, location, and agenda items.

16. Adjourn

Further information, questions, or comments concerning any aspect of this meeting should be directed to Mr. Paul R. Nelson of Lone Star Groundwater Conservation District, 655 Conroe Park North Drive, Conroe, TX 77303; pnelson@lonestargcd.org, or (936) 494-3436.

COMMITTEE MEETING

NOTICE OF OPEN MEETING

As required by Section 36.108(e), Texas Water Code, a meeting of the Groundwater Management Area 14 Joint Planning Committee, comprised of representatives from the following groundwater conservation districts located wholly or partially within Groundwater Management Area 14: Bluebonnet GCD, Brazoria County GCD, Lone Star GCD, Lower Trinity GCD, and Southeast Texas GCD will be held on Tuesday, June 24, 2014, at 1:30 pm at the offices of the Lone Star Groundwater Conservation District, located at 655 Conroe Park North, Conroe, Texas 77303.

At this meeting, the following business may be considered and recommended for Joint Planning Committee possible action:

1. Call to order

- 2. Welcome and Introductions
- 3. Public Comment

(Public comment is limited to a maximum of 5 minutes per speaker and/or 30 minutes total for all speakers)

- 4. Receipt of Posted Notices
- 5. Discussion and possible action to approve minutes of April 30, 2014 GMA 14 Joint Planning Meeting.
- 6. Discussion and consideration of aquifers located in whole or in part in GMA 14 for which requests have been received for possible declaration as non-relevant aquifers for the purposes of joint planning.

Meeting will be convened as a meeting of the GMA 14 Joint Planning Interlocal Agreement Participants.

- 7. Briefing and consideration of results from the modified predictive simulation utilizing GMA 14 approved pumping amounts in the updated Northern Gulf Coast Aquifer (also referred to as the Houston Area Groundwater Model).
- 8. Briefing on draft statements of Desired Future Conditions based on execution of the updated Northern Gulf Coast Aquifer GAM.
- 9. Briefing and consideration of hydrological conditions, including for each aquifer in the management area total estimated recoverable storage, average annual recharge, inflows, and discharge, as required by Texas Water Code Chapter 36.108 (d) (3)
- 10. Briefing and discussion of environmental impacts, including impacts on spring flow and other interactions between groundwater and surface water, as required by Texas Water Code Chapter 36.108 (d) (4).
- 11. Briefing and discussion of the impacts of proposed desired future conditions on subsidence, as required by Texas Water Code Chapter 36.108 (d) (5).
- 12. Discuss funding levels, participation, and any other aspects of the Interlocal Agreement and take possible action.
- 13. Presentation and discussion by Districts of recent activities of interest to or impacting the GMA 14 planning group.

GMA 14 Interlocal Agreement Participants meeting will be adjourned

- 14. Review of progress to date for Groundwater Management Area 14 Joint Planning.
- 15. Discussion of next meeting date, location, and agenda items.

16. Adjourn

Further information, questions, or comments concerning any aspect of this meeting should be directed to Mr. Paul R. Nelson of Lone Star Groundwater Conservation District, 655 Conroe Park North Drive, Conroe, TX 77303; pnelson@lonestargcd.org, or (936) 494-3436.

BLUEBONNET GROUNDWATER CONSERVATION DISTRICT

Public Hearing on Proposed Desired Future Conditions

Wednesday, September 16, 2015 6:00 PM

Bluebonnet Groundwater Conservation District Board Room, Suite B & C 303 East Washington Avenue Navasota, Texas

<u>AGENDA</u>

- 1. Call to order
- 2. Public Comment

(Public comment is limited to a maximum of 3 minutes per speaker and/or 30 minutes total time for all speakers)

3. Hearing on the proposed desired future conditions-Discussion and possible action regarding public comment on the proposed desired future conditions ("DFCs") for the Gulf Coast Aquifer, Carrizo-Wilcox Aquifer, and Yegua-Jackson Aquifer underlying Austin, Grimes, Walker, and/or Waller Counties, Texas, in accordance with Section 36.108(d-2) of the Texas Water Code. The acceptable levels of drawdown for each subdivision of the aquifer are measured in terms of water level drawdowns over the proposed current planning cycle measured in feet from 2009 estimated water levels or from 1890 estimated subsidence conditions. For Bluebonnet GCD, the relevant proposed DFCs include the following:

Formations of the Gulf Coast Aquifer

Austin County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 39 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 76 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Austin County should not exceed approximately 2.83 feet by the year 2070.

Grimes County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 5 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 5 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 6 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 52 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Grimes County should not exceed approximately 0.12 feet by the year 2070.

Walker County

- From estimated year 2009 conditions, the average draw down of the Evangeline Aguifer should not exceed approximately 9 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 42 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Walker County should not exceed approximately 0.04 feet by the year 2070.

Waller County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 39 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 39 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 40 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 101 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Waller County should not exceed approximately 4.73 feet by the year 2070.

Carrizo Sand Aquifer

Grimes County

 From estimated 2010 conditions, the average drawdown of the Carrizo Sand Aquifer should not exceed approximately 52.8 feet average draw down across the area of occurrence of the aquifer.

Walker County

 From estimated 2010 conditions, the average drawdown of the Carrizo Sand Aquifer should not exceed approximately 45.7 feet average draw down across the area of occurrence of the aquifer.

Queen City Aquifer

Grimes County

 From estimated 2010 conditions, the average drawdown of the Queen City Aquifer should not exceed approximately 16.8 feet average draw down across the area of occurrence of the aquifer.

Walker County

 From estimated 2010 conditions, the average drawdown of the Queen City Aquifer should not exceed approximately 21.0 feet average draw down across the area of occurrence of the aquifer.

Sparta Aquifer

Grimes County

 From estimated 2010 conditions, the average drawdown of the Sparta Aquifer should not exceed approximately 14 feet average draw down across the area of occurrence of the aquifer.

Walker County

• From estimated 2010 conditions, the average drawdown of the Sparta Aquifer should not exceed approximately 19.5 feet average draw down across the area of occurrence of the aquifer.

Yegua-Jackson Aquifer

Grimes County

- From estimated 2010 conditions, the average drawdown of the unconfined portion of the Yegua should not exceed approximately 10 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the confined portion of the Yegua should not exceed approximately 15 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the brackish confined portion of the Yegua should not exceed approximately 20 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the unconfined portion of the Jackson should not exceed approximately 10 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the confined portion of the Jackson should not exceed approximately 15 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the brackish confined portion of the Jackson should not exceed approximately 20 feet average draw down across the area of occurrence of the aquifer.

Walker County

- From estimated 2010 conditions, the average drawdown of the unconfined portion of the Yegua should not exceed approximately 10 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the confined portion of the Yegua should not exceed approximately 15 feet average draw down across the area of occurrence of the aguifer.
- From estimated 2010 conditions, the average drawdown of the brackish confined portion of the Yegua should not exceed approximately 20 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the unconfined portion of the Jackson should not exceed approximately 10 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the confined portion of the Jackson should not exceed approximately 15 feet average draw down across the area of occurrence of the aquifer.
- From estimated 2010 conditions, the average drawdown of the brackish confined portion of the Jackson should not exceed approximately 20 feet average draw down across the area of occurrence of the aquifer.

4. Adjourn

Agenda items may be considered, discussed and/or acted upon in a different order than the order set forth above.

Executive Session

The Board of Directors of the Bluebonnet Groundwater Conservation District reserves the right to adjourn into Executive (Closed) Session at any time during the course of this meeting to discuss any of the Items listed on this agenda, as authorized by the Texas Government Code, Sections 551.071 (Consultations with Attorney), 551.072 (Deliberations about Real Property), 551.073 (Deliberations about Gifts and Donations), 551.074 (Personnel Matters), 551.076 (Deliberations about Security Devices), and 551.086 (Economic Development). No final action will be taken in Executive Session.

BLUEBONNET GROUNDWATER CONSERVATION DISTRICT

Board of Directors Meeting
And "Desired Future Conditions" Public Hearing

Wednesday, September 16, 2015 6:00 PM

Bluebonnet Groundwater Conservation District Board Room, Suite B & C 303 East Washington Avenue Navasota, Texas

In attendance:

Directors - Beckendorff, Blezinger. Browne, Eppler, Hopper, Huebner, Minze, Morrison, Patout, and Reed Staff - General Manager Holland, Office Manager Proffitt, and Registration Assistant Milatovich Consultants — Attorney Dugat and Hydrologist Dr. Hutchison Visitors - Michael Thornhill and Bob Renbarger.

Minutes of the Public Hearing

1. Call to order.

There being a quorum present, the public hearing on Desired Future Conditions the President called to order at 6:10 PM.

2. Public Comment.

Mr. Michael Thornhill, Thornhill Group, Inc., on behalf of Quadvest and other investment owned utilities of Montgomery and other counties — Proposed that DFCs should be aquifer based rather than subdivided by county lines which do not represent hydro-geological boundaries. Mr. Thornhill proposed that for the Jasper aquifer 97% of storage from predevelopment of the aquifer remain in storage in 2070, for the Evangeline aquifer, 98% and for the Chicot aquifer 97%. These proposed alternative DFCs will be submitted in writing to the District by October 5, 2015.

3. Discussion and hearing on the proposed desired future conditions-Discussion and possible action regarding public comment on the proposed desired future conditions ("DFCs") for the Gulf Coast Aquifer, Carrizo-Wilcox Aquifer, and Yegua-Jackson Aquifer underlying Austin, Grimes, Walker, and/or Waller Counties, Texas, in accordance with Section 36.108(d-2) of the Texas Water Code.

General Manager Holland outlined the joint planning process and timeline of actions to date and remaining for the Board and GMA 14. GM Holland proposed the Carrizo, Queen-City, Sparta, and Yegua-Jackson Aquifers in Grimes and Walker Counties be considered not relevant for purposes of joint planning process. Dr. Hutchison agreed with General Manager Holland's proposal adding decisions regarding these aquifers by the Bluebonnet GCD will have no affect on surrounding Districts.

Director Reed moved that the Board direct the GM and consultants to complete the documentation required to designate the Carrizo, Queen City, Sparta, and Yegua-Jackson Aquifers in Grimes and Walker Counties as not relevant for the purposes of joint planning. Director Morrison seconded. *Motion carried.*

4. Adjourn.

Public Hearing on Desired Future Conditions was adjourned by the President at 6:28 PM.

Minutes of the Public Hearing

5. Call to order.

There being a quorum present, the President called the meeting to order at 6:29 PM.

6. Public Comment.

No comments were made.

7. Discussion and possible action to approve Amended FY 2015 District Budget.

GM Holland presented and reviewed the amended FY 2015 District Budget.

Director Minze asked about the permit revenues item of the budged. GM Holland documented increases associated with permitting of hydraulic fracturing wells, new non-exempt wells, and replacement wells completed within the District. Director Minze moved that the Board approve the amended FY 2015 District Budget. Director Browne seconded, *motion carried*.

8. Discussion and possible action to approve FY 2016 District Budget

GM Holland presented and reviewed the FY 2016 District Budget. GM Holland noted the addition of the retirement plan item as approved by the Executive Committee following the presentation from the Texas County & District Retirement System with 4% employee contribution and 100% District matching. GM Holland also outlined an item directed toward redevelopment of District database structure into a new platform. Several questions were asked regarding the direction and outlook on the redevelopment project. Director Morrison moved that the Board approve FY 2016 District Budget. Director Eppler seconded, *motion carried*.

9. Discussion and possible action to approve designations for Money Market Account

GM Holland presented and reviewed the designations for the Money Market Account. Discussions continued regarding the redevelopment project and it appearing both in the budget and as a designation. Director Browne moved that the Board approve the designations for the Money Market Account. Director Morrison seconded, *motion carried*.

10. Discussion and possible action to designate dates and times for FY 2016 Board of Directors Meetings

Director Reed asked for clarification if there was a meeting next week (Sept. 21, 2015) as indicated in the memo. Director Eppler pointed out this is a typo and should be Sept. 21, 2016.

GM Holland noted the July 20, 2016 meeting date will be addressed for rescheduling at the April 20, 2016 Board Meeting due to conflict with groundwater conferences occurring that week. A correction noted by Director Eppler to the September meeting year was offered as an amendment.

Director Reed moved that the Board designate the dates and times for FY 2016 Board Meetings as amended. Director Beckendorff seconded, *motion carried*.

11. Adjourn

The meeting was adjourned by the President at 7:08 PM.

The above minutes of the Public Hearing of the Future Desired Conditions and regular meeting of the Board of Directors of the Bluebonnet Groundwater Conservation District held on September 16, 2015 were approved and adopted by that Board on October 21, 2015.

J Jared Patout, President

NOTICE OF PUBLIC HEARING

BRAZORIA COUNTY GROUNDWATER CONSERVATION DISTRICT BOARD OF DIRECTORS

Notice is hereby given that the Board of Directors of the Brazoria County Groundwater Conservation District will hold a public hearing at 4:00 p.m. on Thursday, September 10, 2015 in the District Office, Court House West Annex, 451 N. Velasco Street, Suite 140, Angleton, Texas. After the public hearing the Board will deliberate, discuss, consider or take final action on any or all of the following matters:

A. Resolution for approval of proposed desired future conditions for all aquifers in Groundwater Management Area 14

A copy of the Resolution is available for viewing at the District's office.

Any person who desires to appear and present testimony, evidence, exhibits, or other information may do so in person, by counsel or both. Copies of the rules governing the conduct of the hearing are available at the District's office. Special arrangements for disabled persons may be made by calling (979) 864-1078.

Sherilyn Plenti

Administrator for District

Doyce Hudman

Joyce Hudman County Clerk Brazoria County, Texas

NOTICE OF MEETING OF THE BRAZORIA COUNTY GROUNDWATER CONSERVATION DISTRICT BOARD OF DIRECTORS

Notice is hereby given that the Board of Directors of the Brazoria County Groundwater Conservation District will meet at 4:00 p.m. on Thursday, September 10, 2015 in the District Office, Court House West Annex, 451 N. Velasco Street, Suite 140, Angleton, Texas. At said meeting the Board will deliberate, discuss, consider and / or take final action on any or all of the following matters:

AGENDA

- I. CALL TO ORDER
- II. ROLL CALL
- III. APPROVE MINUTES OF THE MEETING OF: August 13, 2015
- IV. PUBLIC APPEARANCES:

Members of the public may request permission to address the Board of Directors. Specific factual information or a recitation of existing policy may be furnished in response to an inquiry made by a member of the general public, but any deliberation, discussion, or decision with respect to ay subject about which the inquiry was made shall be limited to a proposal to place such subject on the agenda for a subsequent meeting for which notice is provided in compliance with the Texas Open Meetings Act unless said notice appears herein. The public is reminded that there is a five (5) minute time limit as outlined in Brazoria County Groundwater Conservation District Order #07-06-05 dated June 14, 2007.

V. FORMAL REPORTS AND PRESENTATIONS:

- A. USGS Presentation of 2015 Water Level Altitudes and Changes
- B. Freese & Nichols, Inc. Present analysis of BCGCD Spatial Data

VI. NEW BUSINESS:

A. Fiscal:

Joyce Hudman

Joyce Hudman County Clerk Brazoria County, Texas

- 1. Financial Report
- 2. Approve invoices for payment
- 3. Approve FY2015 Budget Amendment
- 4. Approve FY2016 Administrative Fee Schedule
- 5. Approve FY2016 Budget

B. Administrative:

- 1. Approve proposal from Freese & Nichols, Inc. to Prepare the 2015 Annual Report
- 2. Conduct public hearing and consider action regarding permit applications:

5. Review current drought monitor report

Joyce Hudman County Clerk Brazoria County, Texas

6. Schedule public hearing on Thursday, October 8, 2015 at 4:00 p.m. in the District Office to consider permit applications

VII. POSSIBLE FUTURE AGENDA ITEMS:

VIII. ADJOURN

Administrator for District

NOTE: Items will not necessarily be presented in the order they are posted The Brazoria County Groundwater Conservation District is committed to compliance with the Americans with Disabilities Act (ADA). Reasonable accommodations and equal opportunity for effective communications will be provided upon request. Please contact the Brazoria County Groundwater Conservation District Office at (979) 864-1078 at least 24 hours in advance if accommodation is needed.

MINUTES OF THE MEETING OF THE BOARD OF DIRECTORS OF THE BRAZORIA COUNTY GROUNDWATER CONSERVATION DISTRICT

The Board of Directors of the Brazoria County Groundwater Conservation District met Thursday, the 10th day of September, 2015, at 4:00 p.m. in the Brazoria County Groundwater Conservation District Office, 451 N. Velasco Street, 1st Floor, Suite 140, Angleton, Texas.

The meeting was called to order by Director Mueller at 4:00 p.m.

The roll was called of the duly constituted members of the Board, to wit:

Alan Mueller

President

Dennis Davenport

Vice President

Raymond Felder

Secretary

Ronnie Goolsby

Assistant Secretary

Patrick O'Dav

Director

All of said Directors were present except Directors Felder and O'Day, thus constituting a quorum.

Also present for all or part of the meeting were the following: Kent Burkett, General Manager, Sherry Plentl, Administrative Assistant, Greg Ellis, General Counsel, Jason Afinowicz and Philip Taucer of Freese & Nichols, Inc., Mark Kasmarek and David Brown with U.S.G.S., Marvin Jones and Terry Gebhardt.

APPROVE MINUTES:

Motion by Director Mueller; Seconded by Director Goolsby that the Minutes from the meeting on August 13, 2015 be approved as presented. Motion approved with all present voting aye.

FORMAL REPORTS AND PRESENTATIONS:

U.S.G.S. representatives gave a presentation to the Board regarding the 2015 Water Level Altitudes and Changes, and answered related questions posed by Board members.

The report by Freese & Nichols, Inc., regarding the analysis of BCGCD spatial data was deferred until the October 8, 2015 Board Meeting.

1

FINANCIAL REPORT AND BUDGET SUMMARY:

The September, 2015 Statement of Revenues, Expenditures and Changes in Fund Balance was presented for review and a budget status report was given by the General Manager. No action was taken.

APPROVE INVOICES FOR PAYMENT:

Motion by Director Mueller; Seconded by Director Davenport that the invoices presented be approved for payment. Motion approved with all present voting aye.

APPROVE FY 2015 BUDGET AMENDMENT:

Motion by Director Mueller; Seconded by Director Davenport to approve the proposed amendment to the FY 2015 Budget. Motion approved with all present voting aye.

APPROVE FY 2015 ADMINISTRATIVE FEE SCHEDULE:

Motion by Director Davenport; Seconded by Director Goolsby to approve the Administrative Fee Schedule for FY 2016 to reflect no change in fee rates. Motion approved with all present voting aye.

APPROVE FY 2016 BUDGET:

Motion by Director Davenport; Seconded by Director Goolsby to approve the FY 2016 Budget as presented. Motion approved with all present voting aye.

APPROVE PROPOSAL FROM FREESE & NICHOLS, INC., TO PREPARE THE 2015 ANNUAL REPORT:

Motion by Director Davenport; Seconded by Director Goolsby to approve the proposal by Freese & Nichols, Inc. to prepare and present the 2015 Annual Report to the Board of Directors for a fee of \$4,000.00. Motion approved with all present voting aye.

OPEN PUBLIC HEARING REGARDING PERMIT APPLICATIONS:

Motion by Director Davenport; Seconded by Director Goolsby to OPEN a public hearing regarding applications for permits received.

	Owner	Well Location	City	Alloc.	Purpose
1.	Tony White	20794 SH 35	Sweeny	1,000,000	Commercial
2.	K's & J's RV Park	8333 Cr 400	<u>Brazoria</u>	200,000	Public Supply
3.	Haves Family Partnership	9630 Hwy 36	Jones Creek	2,000,000	Commercial
<u>4.</u>	Cedar Lawn Haven of Rest, Inc	. 1014 Sinclair	West Columbia	500,000	<u>Other</u>
<u>5.</u>	Terry Gebhardt	200 Baker Rd	Friendswood	2,000,000	<u>Other</u>

OPEN PUBLIC HEARING REGARDING PROPOSED DESIRED FUTURE CONDITIONS FOR GMA 14:

Motion by Director Mueller; Seconded by Director Davenport to OPEN a public hearing regarding the proposed Desired Future Conditions for Groundwater Management Area 14. Motion approved with all present voting aye.

The public hearing was opened and a presentation of the Desired Future Conditions for GMA 14 as prepared by the committee representing the member Districts was given by representatives from Freese & Nichols, Inc., Discussion followed and the floor was opened to public comment.

Mr. Marvin Jones, representing Quadvest Inc., the City of Conroe and other plaintiffs in the Lone Star GCD litigation, spoke before the Board in opposition to the proposed desired future conditions, and presented a report prepared by R W Harden & Associates related to the desired future conditions for the Gulf Coast Aquifer within GMA 14.

CLOSE PUBLIC HEARING REGARDING PROPOSED DESIRED FUTURE CONDITIONS FOR GMA 14:

With no additional public comments to be heard, the Motion was made by Director Davenport; Seconded by Director Goolsby to close the public hearing regarding proposed Desired Future Conditions for Groundwater Management Area 14.

EXEMPT USE WELL REGISTRATION REPORT:

The Exempt Well Registration Report for the current period was reviewed. No action was taken.

DROUGHT MONITOR REPORT:

The U.S. Drought Monitor map for the State of Texas for September, 2015 was presented for review. No action was taken.

SET HEARING DATE FOR PERMIT APPLICATIONS:

Motion by Director Mueller; Seconded by Director Davenport that a public hearing to consider approval of permit applications or amendments be set for the next meeting of the Board of Directors on Thursday, October 8, 2015 at 4:00 p.m. in the District Office and that the applicants be duly notified. Motion approved with all present voting aye.

POSSIBLE FUTURE AGENDA ITEMS:

- 1. Adopt Desire Future Conditions for GMA 14 on October 8, 2015
- 2. Consider Directors and Officers Liability Policy

ADJOURN:

As there were no further matters to be heard, the motion to adjourn was made by Director Mueller and seconded by Director Goolsby. All present voting aye. The meeting was adjourned at 5:55 p.m.

Approved this 20th day of October, 2015

My Commission Expires

November 08, 2018

LONE STAR GROUNDWATER CONSERVATION DISTRICT NOTICE OF HEARING ON DESIRED FUTURE CONDITIONS September 17, 2015

NOTICE IS HEREBY GIVEN to all interested persons within Montgomery

That the Board of Directors of the Lone Star Groundwater Conservation District ("Lone Star GCD") will hold a public hearing and accept public comment on the proposed desired future conditions ("DFCs") for the Guif Coast Aquifer underlying Montgomery County, Texas, in accordance with Section 36.108(d-2) of the Texas Water Code, The purpose of the tearing is to provide interested members of the public the opportunity to appear and provide comments to the Lone Star GCD related to the proposed DFCs.

The Lone Star GCD is one of five groundwater conservation districts located wholly or partially within Groundwater Management Area 14 ("GMA 14"); the other districts in GMA 14 include Bluebonnet Groundwater Conservation District, Brazoria Groundwater Conservation District, Lower Trinity Groundwater Conservation District, and Southeast Texas Groundwater Conservation District, and Southeast Texas Groundwater Conservation District, At the last GMA 14 joint planning meeting, hald on June 24, 2015, the district representatives voted unanimously to approve the proposed DFCs, which have been distributed to the districts for a 90-day comment period and public hearing,

The proposed DFCs approved by the district representatives of GMA 14 are described in terms of acceptable drawdown levels for each subdivision of the Gulf Coast Adulfer, including the Chicot, Evangeline, Burkeville, and Jasper, for each county located within GMA 14, or in land surface subsidence, as applicable. The acceptable levels of drawdown for each subdivision of the aquifer are measured in terms of water level drawdowns over the proposed current planning cycle measured in feet from 2009 estimated water levels. For Montgomery County, the relevant proposed DFCs include the following:

From estimated year 2009 conditions, the average draw down of the Chicot aquifer should not exceed approximately 26 feet

after 61 years.
From estimated year 2009 conditions, the average draw down of the Evangeline aquiter should not exceed approximately -4 feet after 61 years.

reet after b1 years.
From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately -4 feet after 61 years.
From estimated year 2009 conditions, the average draw down of the Jasper aquifer should not exceed approximately 34 feet after 61 years.

This hearing will be held on September 17, 2015, beginning at 8:30 a.m., at the Lone Star GCD office in the James B. "Jim" Wesley Board Room, 655 Conroe Park North Drive, Conroe, Texas 77303.

Any person who desires to appear at the hearing and present Any person who desires to appear at the hearing and present comment or other Information on the proposed DFCs may do so inperson, by legal representative, or both. Limits may be placed on the amount of time that each person is allowed to present verbal comments, but written comments may also be submitted. Those wishing to provide advanced written comment on the proposed DFCs may also do so prior to the hearing date by regular mail services addressed to Kathy Turner Jones, Lone Star GCD General Manager at 655 Conroe Park North Drive, Conroe, Texas 77303, or by facsimile at (936) 494-3438. (Note: Written comments will be accepted through October 4, 2015.) The hearing posted in this notice may be recessed from day to day or continued where appropriate.

This public hearing is available to all persons regardless of disability. If you require special assistance to attend the hearing, please contact the Lone Star GCD at (936) 494-3436 at least 24 hours in advance of the hearing.

A copy of the proposed DFCs may be requested by email at kjones@ lonestargcd.org, is available for reviewing or downloading at www. lonestargcd.org, and may be reviewed, inspected, or obtained in person at the Lone Star GCD office located at 655 Conroe Park North Drive, Conroe, Texas 77303. All questions or requests for additional information regarding the proposed DFCs may be submitted to Lone Star GCD General Manager, Kathy Turner Jones. Flease contact Ms. Jones by telephone at (936) 494-3436 or by visiting the Lone Star GCD office located at 655 Conroe Park North Drive, Conroe, Texas 77303. CC 08/26, 09/02/15

LONE STAR GROUNDWATER CONSERVATION DISTRIG Tourier
NOTICE OF HEARING ON DESIRED FUTURE CONTINUED COUNTY, TEXAS
September 17, 2015

NOTICE IS HEREBY GIVEN to all Interested persons within Montgomery County, Texas:

That the Board of Directors of the Lone Star Groundwater Conservation District ("Lone Star GCO") will hold a public bearing and accept public comment on the proposed desired future conditions ("DFOs") for the Gulf Coast Aquifer underlying Montgomery County, Texas, in accordance with Saction 36.108(d-2) of the Texas Weter Code. The purpose of the hearing is to provide interested members of the public the opportunity to appear and provide comments to the Lone Star GCD related to the proposed DFCs.

The Lone Star GCD is one of five groundwater conservation districts located wholly or partially within Groundwater Management Area 14 ("GMA 14"); the other districts in GMA 14 include Bluebonnet Groundwater Conservation District, Brazoria Groundwater Conservation District, Lower Trinity Groundwater Conservation District, and Southeast Texas Groundwater Conservation District. At the last GMA 14 joint planning meeting, held on June 24, 2015, the district representatives voted unanimously to approve the proposed DFCs, which have been distributed to the districts for a 90-day comment period and public hearing.

The proposed DFCs approved by the district representatives of GMA 14 are described in terms of acceptable drawdown taxels for each subdivision of the Gulf Coast Aquifer, Including the Chicot, Evangeline, Burkeville, and Jasper, for each county located within GMA 14, or in land surface subsidence, as applicable. The acceptable levels of drawdown for each subdivision of the aquifer are measured in terms of water level drawdowns over the proposed current planning cycle measured in feet from 2009 estimated water levels. For Montgomery County, the relevant proposed DFCs include the following:

 From estimated year 2009 conditions, the average draw down of the Chicot aquifer should not exceed approximately 26 feet after 61 years.

 From estimated year 2009 conditions, the average draw down of the Evangeline aquifer should not exceed approximately -4 feat after 61 years.

From estimated year 2008 conditions, the average draw down of the Burkeville confining unit should not exceed approximately -4 feet after 81 years.

 From estimated year 2009 conditions, the average draw down of the Jasper aquifer should not exceed approximately 34 feet after 61 years.

This hearing will be held on September 17, 2015, beginning at 8:30 a.m., at the Lone Star GCD office in the James 8. "Jim" Wesley Board Room, 655 Conros Park North Drive, Conros, Texas 77303.

Any person who desires to appear at the hearing and present comment or other information on the proposed DFCs may do so in person, by legal representative, or both. Limits may be placed on the amount of time that each person is allowed to present verbal comments, but written comments may also be submitted. Those wishing to provide advanced written comment on the proposed DFCs may also do so prior to the hearing date by regular mall services addressed to Kathy Turner Jones, Lone Star GCD General Manager at 655 Conroe Park North Drive, Conroe, Texas 77303, or by facsimile at (936) 494-3438. (Note: Written comments will be accepted through October 4, 2015.) The hearing posted in this notice may be recessed from day to day or continued where appropriate.

This public hearing is available to all persons regardless of disability. If you require special assistance to attend the flearing, please contact the Lone Star GCD at (936) 494-3436 at least 24 hours in advance of the hearing.

A copy of the proposed DFCs may be requested by small at kjones@lonestargcd.org, is available for reviewing or downloading at www.kidnestargcd.org, and may be raviewed, inspected, or obtained in person at the Lone Star GCD office located at 655 Conros Park North Drive, Conros, Texas 77303. All questions or requests for additional information regarding the proposed DFCs may be submitted to Lone Star GCD General Manager, Kathy Turner Jones. Please contact Ms. Jones by telephone at (936) 494-3436 or by visiting the Lone Star GCD office located at 655 Conros Park North Drive, Conros, Texas 77303.

MARK TURNBULL, COUNTY CLERK
MONTGOMERY COUNTY, TEXAS

LONE STAR GROUNDWATER CONSERVATION DISTRICT NOTICE OF PUBLIC HEARING ON PROPOSED DFC's

8:30 a.m., Thursday, September 17, 2015 Lone Star GCD – James B. "Jim" Wesley Board Room 655 Conroe Park North Drive Conroe, Texas 77303

The Lone Star GCD Board of Directors has scheduled a public hearing to accept public comment on the proposed desired future conditions ("DFCs") for the Gulf Coast Aquifer underlying Montgomery County, Texas, in accordance with Section 36.108(d-2) of the Texas Water Code. The purpose of the hearing is to provide interested members of the public the opportunity to appear and provide comments to the Lone Star GCD related to the proposed DFCs.

The Notice of Hearing on Desired Future Conditions, as provided in the attached document, shall be considered incorporated in its entirety hereto.

ATTACHMENT

Attachment A:

LONE STAR GROUNDWATER CONSERVATION DISTRICT NOTICEOF HEARING ON DESIRED FUTURE CONDITIONS September 17, 2015

- 1. Call to Order and Declare Hearing Open to the Public
- 2. Roll Call
- 3. Presentation on proposed desired future conditions ("DFCs") for the Gulf Coast Aquifer underlying Montgomery County, Texas in accordance with Section 36.108(d-2) of the Texas Water Code
- 4. Receive public comments related to the proposed DFC's.
- 5. Adjourn Public Hearing

The attached agenda schedule for the meeting of the District represents an estimate of the order for the indicated items and is subject to change at any time.

This public work session is available to all persons regardless of disability. If you require special assistance to attend the work session, please contact the Lone Star GCD at 936/494-3436 at least 24 hours in advance of the work session..

At any time during one of the above meetings and in compliance with the Texas Open Meetings Act, Chapter 551, Government Code, Vernon's Texas Codes, Annotated, the Lone Star Groundwater Conservation District Board may meet in executive session on any of the above agenda items for consultation concerning attorney-client matters (§551.071); deliberation regarding real property (§551.072); deliberation regarding prospective gift (§551.073); personnel matters (§551.074); and deliberation regarding security devices (§551.076). Any subject discussed in executive session may be subject to action during an open meeting.

Certification

I, the undersigned authority, do hereby certify that on September 14, 2015, at or before 8:30 a.m., I posted and filed the above notice of Board work session with the Montgomery County Clerk's office and also posted a copy in the front window of the Lone Star GCD office in a place convenient and readily accessible to the general public at all times and that it will remain so posted continuously for at least 72 hours preceding the scheduled time of said Board work session in accordance with the Texas Government Code, Chapter 551.

Kathy Turner Jones, General Manager Lone Star Groundwater Conservation District

ATTACHMENT A:

LONE STAR GROUNDWATER CONSERVATION DISTRICT NOTICE OF HEARING ON DESIRED FUTURE CONDITIONS

September 17, 2015

NOTICE IS HEREBY GIVEN to all interested persons within Montgomery County, Texas:

That the Board of Directors of the Lone Star Groundwater Conservation District ("Lone Star GCD") will hold a public hearing and accept public comment on the proposed desired future conditions ("DFCs") for the Gulf Coast Aquifer underlying Montgomery County, Texas, in accordance with Section 36.108(d-2) of the Texas Water Code. The purpose of the hearing is to provide interested members of the public the opportunity to appear and provide comments to the Lone Star GCD related to the proposed DFCs.

The Lone Star GCD is one of five groundwater conservation districts located wholly or partially within Groundwater Management Area 14 ("GMA 14"); the other districts in GMA 14 include Bluebonnet Groundwater Conservation District, Brazoria Groundwater Conservation District, Lower Trinity Groundwater Conservation District, and Southeast Texas Groundwater Conservation District. At the last GMA 14 joint planning meeting, held on June 24, 2015, the district representatives voted unanimously to approve the proposed DFCs, which have been distributed to the districts for a 90-day comment period and public hearing.

The proposed DFCs approved by the district representatives of GMA 14 are described in terms of acceptable drawdown levels for each subdivision of the Gulf Coast Aquifer, including the Chicot, Evangeline, Burkeville, and Jasper, for each county located within GMA 14, or in land surface subsidence, as applicable. The acceptable levels of drawdown for each subdivision of the aquifer are measured in terms of water level drawdowns over the proposed current planning cycle measured in feet from 2009 estimated water levels. For Montgomery County, the relevant proposed DFCs include the following:

- From estimated year 2009 conditions, the average draw down of the Chicot aquifer should not exceed approximately 26 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline aquifer should not
 exceed approximately -4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately -4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper aquifer should not exceed approximately 34 feet after 61 years.

This hearing will be held on September 17, 2015, beginning at 8:30 a.m., at the Lone Star GCD office in the James B. "Jim" Wesley Board Room, 655 Conroe Park North Drive, Conroe, Texas 77303.

Any person who desires to appear at the hearing and present comment or other information on the proposed DFCs may do so in person, by tegal representative, or both. Limits may be placed on the amount of time that each person is allowed to present verbal comments, but written comments may also be submitted. Those wishing to provide advanced written comment on the proposed DFCs may also do so prior to the hearing date by regular mail services addressed to Kathy Turner Jones, Lone Star GCD General Manager at 655 Conroe Park North Drive, Conroe, Texas 77303, or by facsimile at (936) 494-3438. (Note: Written comments will be accepted through October 4, 2015.) The hearing posted in this notice may be recessed from day to day or continued where appropriate.

This public hearing is available to all persons regardless of disability. If you require special assistance to attend the hearing, please contact the Lone Star GCD at (936) 494-3436 at least 24 hours in advance of the hearing.

A copy of the proposed DFCs may be requested by email at kjones@lonestargcd.org, is available for reviewing or downloading at www.lonestargcd.org, and may be reviewed, inspected, or obtained in person at the Lone Star GCD office located at 655 Conroe Park North Drive, Conroe, Texas 77303. All questions or requests for additional information regarding the proposed DFCs may be submitted to Lone Star GCD General Manager, Kathy Turnar Jones. Please contact Me. Jones by telephone at (936) 494-3436 or by visiting the Lone Star GCD office located at 655 Conroe Park North Drive, Conroe, Texas 77303.

LONE STAR GROUNDWATER CONSERVATION DISTRICT

September 17, 2015

MINUTES OF PUBLIC HEARING ON GROUNDWATER MANAGEMENT AREA 14 PROPOSED DESIRED FUTURE CONDITIONS

The Board of Directors of the Lone Star Groundwater Conservation District ("District") met in regular session, open to the public, in the District Board Room located at 655 Conroe Park North Drive, Conroe, Texas, within the boundaries of the District on September 17, 2015.

President Tramm called to order the Public Hearing on Groundwater Management Area (GMA) 14 proposed Desired Future Conditions (DFCs) at 8:50 a.m.

The roll was called of the members of the Board of Directors, to wit:

Sam W. Baker
John Bleyl, PE
Jace Houston
Roy McCoy, Jr.
Rick Moffatt
Jim Stinson, PE
Richard J. Tramm
Scott Weisinger, PG
W. B. Wood

(

Members of the Board were present, with the exception of Director Baker, Director Houston, Director McCoy, and Director Weisinger, thus constituting a quorum of the Board of Directors. Also, in attendance were Kathy Turner Jones, District General Manager; Brian Sledge, General Counsel; Shauna Fitzsimmons, Attorney; Mark Lowry, District Consultant; District staff; and members of the public. Copies of the public sign-in sheets are attached hereto as Exhibit "A".

President Tramm announced that the public hearing on proposed DFCs was called to order and open to the public. President Tramm stated that the purpose of the public hearing was for the Board of Directors to hear comments on the proposed DFCs adopted by Groundwater Management Area 14 (GMA 14) that are relevant to the District. President Tramm noted for the record that notice of this hearing was published and posted as required by Section 36.063(b) and (c) of the Texas Water Code. President Tramm stated that the adopted proposed DFCs were developed by the various groundwater conservation district representatives that comprise GMA 14. President Tramm stated that it is the District's current intention that the Board of Directors will discuss the summary report and any suggested revisions in conjunction with the regular October Board of Directors meeting on October 13th, and that comments will be accepted until 5 PM, October 5, 2015.

Bill Mullican, who serves as a consultant for GMA 14 on the DFC development process, gave an overview of the DFC process and the proposed DFCs that have been adopted by GMA 14 and are being considered during the current 90-day public comment period. Mr. Mullican discussed the different GMAs in Texas with a focus on GMA 14, the new DFC adoption process, the GMA 14 considerations of the nine statutory factors set forth in Section 36.108, Water Code, set forth in Section 36.108(d-2), Water Code, the statutory balancing test, and the DFCs proposed for Montgomery County. Mr. Mullican noted that information regarding the proposed DFCs, including meeting agendas, all public comments, presentations, reports, and other relevant documentation, has been made available to the public for the duration of the 90-day public comment period. A link to where all relevant information is included in Mr. Mullican's presentation. A copy of the presentation is attached hereto as Exhibit "B".

Public comments received:

Scott Sustman, President of the Lake Conroe Communities Network, presented written testimony. The primary focus of Mr. Sustman's comments were centered on the socioeconomic impacts of fluctuating water levels at Lake Conroe. A copy of the testimony is attached hereto as Exhibit "C".

Mike Thornhill, a hydrogeologist with the Thornhill Group, and representing Quadvest, provided oral comments stating his belief that the proposed DFCs are not valid legally, based on his interpretation of Texas water law. Mr. Thornhill's comments primarily focused on his belief that DFCs should be aquifer-based. Mr. Thornhill did not provide any written comments or provide a written presentation during the hearing.

Bob Harden, a hydrogeologist with R W Harden & Associates and representing the City of Conroe, gave a presentation on artesian pressure versus water table storage in aquifers. A copy of the presentation is attached hereto as Exhibit "D".

Marty Jones, an attorney with Sprouse, Shrader, Smith PLLC, and representing Quadvest, provided oral comments in support of comments previously made during the hearing. He stated that all the districts in GMA 14 should unite and consider joint planning and have a DFC for each aquifer, in lieu of what he considers to be DFCs based on county boundaries. Mr. Jones did not provide any written comments for the hearing, however, he had previously submitted a letter to all districts in GMA 14 and asked that it be included in the record. A copy of the letter, dated August 25, 2015, is attached hereto as Exhibit "E".

Wade Oliver, a hydrogeologist with INTERA, Inc., representing Montgomery County WCID #1, Porter Special Utility District, San Jacinto River Authority, Southern Montgomery County Municipal Utility District, The Woodlands Joint Powers Agency, City of Houston, Fort Bend Subsidence District, Harris-Galveston Subsidence District, and the North Harris County Regional Water Authority, provided a presentation on the factors that GCDs must consider when adopting proposed DFCs. As part of this presentation, Mr. Oliver provided a technical overview of the concept of Total Estimated Recoverable Storage that must be considered when adopting proposed DFCs and compared it to the functional realities of maintaining artesian head in water wells in confined aquifers. A copy of the presentation is attached hereto as Exhibit "F".

Van Kelly, with INTERA, Inc., and representing Montgomery County WCID #1, Porter Special Utility District, San Jacinto River Authority, Southern Montgomery County Municipal

ĺ

Utility District, The Woodlands Joint Powers Agency, City of Houston, Fort Bend Subsidence District, Harris-Galveston Subsidence District, and the North Harris County Regional Water Authority, provided a presentation on debunking proposed storage-based (TERS) Desired Future Conditions that have been suggested by some of the other commenters who are in opposition to the adopted proposed DFCs developed by GMA 14. In summary, Mr. Kelley highlighted that DFCs based on TERS are out of step with the District's Mission Statement, that they do not represent "better science," that there is no logical basis for the storage-based DFCs that have been suggested by other commenters to the District, and that those suggested storage-based DFCs are based on "reverse engineering" just as the commenters who have recommended them have complained of when referring to the DFCs developed by GMA 14. A copy of the presentation is attached hereto as Exhibit "G".

President Tramm announced that the sign-in sheet indicated that everyone who wanted to present comments on the proposed DFCs had now done so, but asked if there was anyone present who desired to provide comments. No one present at the hearing indicated a desire to present further comment. President Tramm then noted that the administrative record would remain open for the submission of any additional written comments to the District until 5:00 PM, October 5, 2015.

President Tramm adjourned the public hearing on GMA 14 proposed DFCs at 10:43 a.m.

PASSED, APPROVED, AND ADOPTED THIS 13TH DAY OF OCTOBER, 2015.

Rick Moffatt, Board Secretary

NOTICE OF PUBLIC HEARING ON DESIRED FUTURE CONDITIONS FOR THE LOWER TRINITY GROUNDWATER CONSERVATION DISTRICT

September 11, 2015

September 11, 2015

NOTICE IS HEREBY GIVEN to all interested persons within Polk and San Jacinto Counties, Texas: That the Board of Directors of the Lower Trinity Groundwater Conservation District ("Lower Trinity GCD") will hold a public hearing and accept public comment on the proposed desired future conditions ("DFCs") for the Gulf Coast Aquiler underlying Polk and San Jacinto Counties, Texas, in accordance with Section 36.108(d-2) of the Texas Water Code. The purpose of the hearing is to provide interested members of the public the opportunity to appear and provide comments to the Lower Trinity GCD related to the proposed DFCs.

The Lower Trinity GCD is one of five groundwater conservation districts located within Groundwater Management Area 14 ("GMA 14"); the other districts in GMA 14 include Bluebonnet Groundwater Conservation District, Brazoria Groundwater Conservation District, Lone Star Groundwater Conservation District, and Southeast Texas Groundwater Conservation District. At the last GMA 14 joint planning meeting, held on June 24, 2015, the district representatives voted unanimously to approve the proposed DFCs, which have been distributed to the districts for a 90-day comment period and public hearing.

The proposed DFCs approved by the district representatives of GMA 14 are described in terms of acceptable drawdown levels for each subdivision of the Gulf Coast Aquifer, including the Chicot, Evangeline, Burkeville, and Jasper, for each county located within GMA 14, or in land surface subsidence, as applicable. The acceptable levels of drawdown for each subdivision of the aquifer are measured in terms of water level drawdowns over the proposed current planning cycle measured in feet from 2009 estimated water levels. For Polk and San Jacinto Counties, the relevant proposed DFCs include the following:

- From estimated year 2009 conditions, the average drawdown of the Chicot aquifer should not exceed approximately 26 feet for Polk County and 22 feet for San Jacinto County after 61 years
- From estimated year 2009 conditions, the average drawdown of the Evangeline aquifer should not exceed approximately 10 feet for Polk County and 19 feet for San Jacinto County after 61 years.
- From estimated year 2009 conditions, the average drawdown of the Burkeville confining unit should not exceed approximately 15 feet for Polk County and 19 feet for San Jacinto County after 61 years.
- From estimated year 2009 conditions, the average drawdown of the Jasper aquifer should not exceed approximately 73 feet for Polk County and 108 feet for San Jacinto County after 61 years.

This hearing will be held on September 11, 2015, beginning at 10:30 a.m., at the Polk County Office Annex, Room 175, located at 602 E. Church St in Livingston, Texas.

Any person who desires to appear at the hearing and present comment or other information on the proposed DPCs may do so in person, by legal representative, or both. Limits may be placed on the amount of time that each person is allowed to present verbal comments, but written comments may also be submitted. Those wishing to provide advanced written comment on the proposed DFCs may also do so prior to the hearing date by regular mail services addressed to Gary Ashmore, Lower Trinity GCD General Manager at P.O. Box 1879, Livingston TX 77351 or by facsimile at (936)

This public hearing is available to all persons regardless of disability. If you require special assistance to attend the hearing, please contact the Lower Trinity GCD at (936) 327-9531 at least 24 hours in advance of the hearing.

A copy of the proposed DFC's may be requested by email at ligedistrict@livingston.net and is available for downloading at www.ltged.org and may be reviewed, inspected, or obtained in person at the Lower Trinity GCD office located at the District office at 602 E. Church Street Room 141 in Livingston, TX. All questions or requests for additional information regarding the proposed DFCs may be submitted to Lower Trinity GCD General Manager, Gary Ashmore. Please contact Mr. Ashmore by telephone at (936) 327-9531 or by visiting the Lower Trinity GCD office located at 602 E. Church St in Livingston, TX 77351.

NOTICE OF PUBLIC HEARING ON DESIRED FUTURE CONDITIONS FOR THE LOWER TRINITY GROUNDWATER CONSERVATION DISTRICT

September 11, 2015

NOTICE IS HEREBY GIVEN to all interested persons within Polk and San Jacinto Counties, Texas: That the Board of Directors of the Lower Trinity Groundwater Conservation District ("Lower Trinity GCD") will hold a public hearing and accept public comment on the proposed desired future conditions ("DFCs") for the Gulf Coast Aquifer underlying Polk and San Jacinto Counties, Texas, in accordance with Section 36.108(d-2) of the Texas Water Code. The purpose of the hearing is to provide interested members of the public the opportunity to appear and provide comments to the Lower Trinity GCD related to the proposed DFCs.

The Lower Trinity GCD is one of five groundwater conservation districts located within Groundwater Management Area 14 ("GMA 14"); the other districts in GMA 14 include Bluchonnet Groundwater Conservation District, Brazoria Groundwater Conservation District, Lone Star Groundwater Conservation District, and Southeast Texas Groundwater Conservation District At the last GMA 14 joint planning meeting, held on June 24, 2015, the district representatives voted unanimously to approve the proposed DFCs, which have been distributed to the districts for a 90-day comment period and public hearing.

The proposed DFCs approved by the district representatives of GMA 14 are described in terms of acceptable drawdown levels for each subdivision of the Gulf Coast Aquifer, including the Chicot, Evangeline, Burkeville, and Jaspor, for each county located within OMA 14, or in land surface subsidence, as applicable. The acceptable levels of drawdown for each subdivision of the aquifer are measured in terms of water level drawdowns over the proposed current planning cycle measured in feet from 2009 estimated water levels. For Polk and San Jacinto Counties, the relevant proposed DFCs include the following:

- From estimated year 2009 conditions, the average drawdown of the Chicot aquifer should not exceed approximately 26 feet for Polk County and 22 feet for San Japinto County after 61 years.
- From estimated year 2009 conditions, the average drawdown of the Evangeline aquifer should not exceed
 approximately 10 feet for Polk County and 19 feet for San Jacinto County after 61 years.
- From estimated year 2009 conditions, the average drawdown of the Burkeville confining unit should not exceed approximately 15 feet for Polk County and 19 feet for San Jacinto County after 61 years.
- From estimated year 2009 conditions, the average drawdown of the Jasper aquifer should not exceed approximately 73 feet for Polk County and 108 feet for San Jacinto County after 61 years.

This hearing will be held on September 11, 2015, beginning at 10:30 a.m., at the Polk County Office Annex, Room 175, located at 602 E. Church St in Livingston, Texas.

Any person who desires to appear at the hearing and present comment or other information on the proposed DFCs may do so in person, by legal representative, or both. Limits may be placed on the amount of time that each person is allowed to present verbal comments, but written comments may also be submitted. Those wishing to provide advanced written comment on the proposed DFCs may also do so prior to the hearing date by regular mail services addressed to Gary Ashmore, Lower Trinity GCD General Manager at P.O. Box 1879, Livingston TX 77351 or by facsimile at (936) 327-9532.

This public hearing is available to all persons regardless of disability. If you require special assistance to attend the hearing, please contact the Lower Trinity GCD at (936) 327-9531 at least 24 hours in advance of the hearing.

A copy of the proposed DFC's may be requested by email at ligadistrict@livingston.net and is available for downloading at www.ligad.org and may be reviewed, inspected, or obtained in person at the Lower Trinity OCD office located at the District office at 602 E. Church Street Room 141 in Livingston, TX. All questions or reguests for additional information regarding the proposed DFCs may be submitted to Lower Trinity GCD General Manager, Gary Ashmore. Please contact Mr. Ashmore by telephone at (936) 327-9531 or by visiting the Lower Trinity GCD office located at 602 E. Church St in Livingston, TX 77351.

LOWER TRINITY GROUNDWATER CONSERVATION DISTRICT BOARD OF DIRECTORS MEETING MINUTES September 11, 2015

Present: Board of Directors Clyde Jordan, Wesley Smith, Charles Whitten, Randy Baker, and Aldney Reeves. In attendance were also Gary Ashmore, Crystal Reddicks, Marvin Jones and Patrick Casarez.

Board President, Clyde Jordan called the meeting to order at 10:30 A.M.

The meeting was opened up for Public Comments regarding the purposed DFC's for the Lower Trinity. Groundwater Conservation District. Mr. Marvin Jones, an attorney representing the City of Conroe in a lawsuit against the Lone Star Groundwater Conservation District addressed the board members and conveyed his client's opinion regarding the proposed DFC's for Montgomery County. Mr. Jones submitted a document into record dated March 10, 2010 with the subject of (a) status of joint planning in groundwater management areas; and (b) use of "geographic areas" in establishing desired future conditions. (Document attached to minutes). Mr. Jones spoke for approximately 30 minutes with the board members. The Public comment period was closed as no other persons where present to speak on the subject.

The meeting was opened up for Public Comments regarding the purposed rules changes to the Lower Trinity Groundwater Conservation District, Rule #4. The Public comment period was closed as no persons where present to speak on the subject.

The meeting was reconvened for regular board meeting business, there where no public comments regarding regular board business.

Aldney Reeves made a motion to adopt the proposed rule changes, Randy Baker seconded, all approved: Proposed change #1 would revise the provisions of Rule 4 – Fees and Reports. To include a waiver of quarterly payments for non-exempt well operators that uses less than 250,000 gallons per quarter. Operators will still be required to provide quarterly water pumpage reports to the District, but only submit the total payment at the end of each year. The General Manager will determine waiver eligibility. Proposed Change #2 would revise the provisions of Rule 4 – Fees and Reports section 4.1. To update the references to match statutory provisions passed during the 2015 Legislative session regarding export of water outside the District. Proposed Change #3 would revise the provisions of Rule 4 – Fees and Reports section 4.3. To include a minimum late fee of \$50.00 per month to be charged instead of 1% per month if the calculated 1% is less than \$50.00 as determined by the General Manager. These rules changes will improve the Districts administration processes and lower costs for Non-Exempt well operators associated with pumpage payments.

The board reviewed the past minutes from the July 10, 2015 Board of Directors meeting. Charles Whitten motioned that the minutes be accepted, Randy Baker seconded the motion and all board members approved.

Aldney Reeves made a motion to approve the proposed DFC's and to have Gary Ashmore vote to approve the proposed DFC's in the future GMA 14 board meetings. (The aquifer-wide DFCs for GMA 14 and the DFC's for each specific aquifer and County.) Randy Baker seconded, all board members approved.

Gary Ashmore presented the General Managers report for July and August, 2015.

Income for the district YTD Actual was \$71,596,58. New Permits, \$450.00, Annual Operating Permits, \$2,600.00, Water Pumping Fees, \$67.940.63, Interest income, \$180.05, Late Fees, \$350.00, Uncategorized income, \$75.90. The expenses for the district YTD is \$80,964.00.

Office: (936) 327-9531 Fax: (936) 327-9532 Email: LtgcDistrict@Livingston.net P.O. Box 1879 Livingston, TX, 77351 GM: Gary Ashmore, AA: Crystal Reddicks

QUARTERLY REPORT: LTGCD has been requested to present a quarterly report to the Polk County Commisioners on September 22, 2015 @ 10:00am.

GROUNDWATER MANAGEMENT PLAN: The following Water District Goals have been completed for 2015: 11A Well Registrations, 11B2 Reducing Waste, 11B3 Public Presentation 11F1 Drought Monitoring, 11C District Invitations, 11D Study Water Quality, 11F3 Economic Impact (DFC's), 11G Public Information Distribution.

Aidney Reeves presented the Financial Report ending 09/09/2015, with a checking account balance of \$14,811.89. The Escrow account balance is \$1,404.56 and the District Investment account balance of \$51,056.43 and the accounts payables are \$1,372.85 for a total balance of \$81,425.25. Our interest income off our District CD investment account is \$1,056.43 No unusual spending items or bills this past month occurred. Randy Baker motioned that we accept the Financial Report and approve payment of all outstanding bills. Wesley Smith seconded and all board members approved.

The board had a lengthy discusion regarding the potential need to ask the States legislative body to allow for future increases in water utility pumping fees by the District. The current fee structure was autorized and calculated based on having a larger population with Liberty County in the District and having revenues in excess of \$500k per year. Liberty County did not vote to join the District and current revenue is less than \$91k per year. The board asked Gary Ashmore to create a set of data showing what other water disticts fee schedules are and to present it at the next board meeting.

The next scheduled Board Meeting is November 6, 2015 at 10:30AM, in room 175 of the Polk County Office Annex

Randy baker motioned that meeting adjourn with Wesley Smith seconding the motion, all board members approved.

Aldney Reeves - Secretary

SOUTHEAST TEXAS GROUNDWATER CONSERVATION DISTRICT NOTICE OF HEARING ON DESIRED FUTURE CONDITIONS September 10, 2015

NOTICE IS HEREBY GIVEN to all Interested persons within Hardin, Jasper, Newton and Tyler Counties, Texas:

Tyler Counties, Texas:

That the Board of Directors of the Southeast Texas Ground-water Conservation District ("SETGED") will hold a public hearing and accept public comment on the proposed desired future conditions ("DFCs") for the Gulf Coast Agulfer underlying the District, in accordance with Section 36,108(d-2) of the Texas Water Code. The purpose of the hearing is to provide interested members of the public the apportunity to appear and provide comments to the SETGED related to the proposed DFCs.

posed DFCs.

The SETGCO is one of five groundwater conservation districts located wholly or partially willnin Groundwater. Menagement Area 14 ("GtMA 14"); the other districts in GMA 14 include Bluebonnet GCD, Brazoria GCD, Lower Trinity GCD, and Lone Star GCD. At the last GMA 14 joint planning meeting, held on June 24, 2015, the district representatives voted unanimously to approve the proposed DFCs, which have been distributed to the districts for a 90-day comment period and public hearing.

The proposed DFCs approved by the district representatives of GMA 14 are described in terms of acceptable drawdown levels for each subdivision of the Gulf Coast Aquiller, including the Chicot, Evangeline, Burkeville, and Jasper, for each county located within GMA 14, or in lend surface subsidence, as applicable. The acceptable levels of drawdown for each subdivision of the aquifer are measured in terms of water level drawdown over the proposed of the acuther are measured in terms of water level drawdowns over the proposed current planning cycle meas-ured in feet from 2009 esti-mated water levels. For the SETGOD the relevant pro-posed DFCa include the follow-ing:

Hardin County
From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 21 feet after 61 years,
From estimated years

years.

From estimated year

2009 conditions, the average
draw down of the Burkeville
Confining Unit should not exceed approximately: 29 feet after 61 years.

From estimated year 2009
conditions, the average draw
down of the Jasper Aquifor
should not exceed approximalely: 89 feet after 61 years.

Jasper County
From estimated year
2009 conditions, the average
draw down of the Chicot Aquifer should not exceed approximately 23 feet after 61 years.

Legal Notices

From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately: 41 feet after 61 years

From estimated year 2009 conditions, the average draw down of the Burkeville Confining Unit should not exceed approximately: 46 feet after 51 years.

From estimated year 2000 conditions the average approximately: 48 feet after 51 years.

From estimated year 2009 conditions, the average draw down of the Jasper Aqui-fer should not exceed approxi-mately: 40 feet after 81 years.

Newton County

From estimated year 2009 conditions, the average draw down of the Chicct Acuifer should not exceed approximatelly 35 feet after 61 years.

From estimated years are should not exceed approximately 35 feet after 61 years.

From estimated years.

From estimated years.

years.

From estimated year

2009 conditions, the average
draw down of the Burkeville
Confining Unit should not exceed approximately: 44 feet after 61 years.

From estimated year
2009 conditions, the average
draw down of the Jasper Aquifer should not exceed approximately: 37 feet after 61 years,

Tyler County

From sslimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 42 feet after 61 years.

From estimated years 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately: 36 feet after 61 years.

years.

From estimated year
2009 conditions, the average
draw down of the Burkeville
Confining Unit should not exceed approximately: 30 feet after 61 years.

From estimated year
2009 conditions, the average
draw down of the Jasper Aquifer should not exceed approximately: 62 feet after 61 years.

This hearing will be held on September 10, 2015, beginn-ing al 9:00 a.m., at the Jesper Newton Electric Co-op Com-munity Room located at 812 S., Margaret Ave., Kirbyville, TX 75956.

75956.

Any person who desires to appear at the hearing and present comment or other Information on the proposed DFCs may do so in person, by legal representative, or both. Limits may be placed on the amount of time that each person is allowed to present verbal comments, but written comments may also be submitted. Those wishing to provide advanced written comment on the proposed DFCs may also do so prior to the hearing date by regular mail services addressed to John Martin, Southeast Texas GCD, at P.O. Box 1407, Jaspar, Texas PGD5, or by facsimile at (409) 383-0799. Written Comments will be accepted through October 4, 2015. The hearing posted in this notice may be receased from day to day or continued where appropriate.

This public hearing is available to all persons regardless of disability. If you require spe-

LEGAL NOTICE

SOUTHEAST TEXAS GROUNDWATER CON-SERVATION DISTRICT NOTICE OF HEARING ON DESIRED FUTURE CON-DITIONS September 10, 2015 NOTICE IS HEREBY GIV-EN to all interested persons within Hardin, Jasper, Newton and Tyler Counties, Texas: That the Board of Directors of the Southeast Texas Groundwater Conservation District ("SETG-CD") will hold a public hearing and accept public comment on the proposed desired future conditions ("DFCs") for the Gulf Coast Aquifer underlying the District, in accordance with Section 36.108(d-2) of the Texas Water Code. The purpose of the hearing is to provide interested members of the public the opportunity to appear and provide comments to the SET-GCD related to the proposed DFCs. The SETGCD is one of five groundwater conservation districts located wholly or partially within Groundwater Management Area 14 ("GMA 14"); the other districts in GMA 14 include Bluebonnet GCD, Brazoria GCD, Lower Trinity GCD, and Lone Star GCD. At the last GMA 14 joint planning meeting, held on June 24, 2015 the district representatives voted unanimously to approve the proposed DFCs, which have been distributed to the districts for a 90-day comment period and public hearing. The proposed DFCs approved by the district representatives of GMA 14 are described in terms of acceptable drawdown levels for each subdivision of the Gulf Coast Aquifer, including the Chicot, Evangeline, Burkeville, and Jasper, for each county located within GMA 14, or in land surface subsidence, as applicable. The acceptable levels of drawdown for each subdivision of the aquifer are measured in terms of draw down of the Jasper Aquifer for reviewing or downloading water level drawdowns over the should not exceed approximate- at www.setgcd.org, and may be proposed current planning cycle measured in feet from 2009 County •From estimated year in person at the Southeast Texas

HOME TEXAS REGISTER TEXAS ADMINISTRATIVE CODE OPEN MEETINGS

Southeast Texas Groundwater Conservation District **Meeting Minutes September 10, 2015** Jasper-Newton Electric Meeting Room Kirbyville, Texas

Directors Present:

Directors Absent: Jim Boone

Linda Powell

Walter R. Glenn, President Roger Fussell, Vice President Bobby Rogers Sam Ashworth Mitch McMillon Wendy Turner Olen Bean Jon Meek Greg Wobbe M. Charles Zimmerman

John Martin, General Manager

John D. Stover, Esq., General Counsel

Public Hearing:

Robyn Summerlin

- Open public hearing: At 9:00 a.m. President Glenn brought to order the Public Hearing regarding GMA 14's proposed Desired Future Conditions ("DFC"). President Glenn asked Manager Martin to conduct a roll call, and a quorum was confirmed with ten Directors present and three absent.
- Receive public comment: President Glenn asked if anyone present wanted to make or provide comments regarding the proposed DFCs. Mr. Marvin Jones, Esq. was present and provided comments on the proposed DFCs. In addition to Mr. Jones' August 25, 2015 letter submitted as written comment of the proposed DFCs (included in meeting materials), he provided two additional documents to the board for consideration: (1) a March 10, 2010 Texas Water Development Board ("TWDB") memo regarding (a) the status of joint planning, and (b) the use of geographic areas in establishing DFC; and (2) a map of the outcrop areas of the Jasper Aquifer across GMA 14.

Additionally, Mr. Jones provided a report on behalf of Mr. Bob Harden titled Evaluation of Desired Future Conditions for the Gulf Coast Aguifer Within GMA 14 (prepared for the City of Conroe).

3. Close public hearing: President Glenn adjourned the Public Hearing on the proposed DFCs at 9:29 a.m.

Regular Board Meeting:

- 1. <u>Call to order</u>: At 9:29 a.m. President Glenn called to order the regular meeting of the Southeast Texas Groundwater Conservation District. President Glenn asked Treasurer Rogers if he would provide an invocation. President Glenn then asked Manager Martin to conduct roll call for the regular meeting. A quorum was confirmed with 10 Directors present and 3 Directors absent (at 9:45 a.m. Director McMillon arrived bringing the total number of Director present to 11).
- 2. <u>Public comment (Comments are restricted to 3 minutes with a total of all comments limited to 30 minutes)</u>: President Glenn asked if anyone present wished to make a public comment. Mr. Jones had stepped out of the meeting room and no other members of the public were present. No comments were made.
- 3. <u>Discussion and possible action to approve the minutes of the July 9, 2015 Board meeting</u>: President Glenn asked if anyone had any questions or comments regarding the July 9, 2015 meeting minutes. No comments were made. Director Bean made motion to approve the minutes of the July 9, 2015 meeting as presented. Director Zimmerman seconded the motion. The motion passed unanimously.
- 4. Review, discussion and possible action on the August and September Treasurer's Reports and approval of payables presented: Treasurer Rogers first gave a thorough review of the District's August Treasurer's Report due to the fact that there was not an August meeting. He also reviewed September's Treasurer's Report and payables presented. He reviewed each of the District's account balances, the monthly payables, and expected FNB operating account balance after the payables have been paid for both the August and September Treasurer's Report. He also commented on the P&L Budget vs. Actual Report, indicating everything looked good, that the District's income is above what has been projected and that the expenses are below expected through August.

Vice President Fussell made motion to approve the Treasurer's Report and payables as presented. Director Bean seconded the motion. The motion passed unanimously.

5. <u>Discussion and possible action regarding annual financial auditors</u>: Manager Martin recalled that late last fall Direct Boone had inquired into the cost effectiveness of our current annual financial auditor. Manager Martin explained that he polled the TAGD group asking what thier annual financial audits were costing and had received 19 responses. He pointed out Item 5 of their monthly meeting materials which showed the annual cost of each of the 19 respondents and the overall average.

Manager Martin stated that several of the responses on the lower end of the scale utilized a firm out of Knippa, TX which is located west of Austin, TX. He stated that after speaking with Gary Ashmore (GM of Lower Trinity GCD) who utilizes this firm, he learned the firm did not provide the annual audit report in an open meeting allowing for questions and interaction between the board and the auditor.

Manager Martin recommend continued use of Axley & Rode but stated that if the Board was interested in finding another auditor a Request for Qualifications would have to be sent out and that any decision to hire another auditor could not be based solely on cost.

Vice President Fussell commented that he appreciated the personal interaction Mr. Carver of Axley & Rode provides. Manager Martin recommended that if the Board was comfortable with utilizing Axley & Rode again that a motion be considered allowing him to engage them for the 2015 annual audit. President Glenn asked if anyone had any further thoughts or comments.

Director Zimmerman inquired as to the location of Axley & Rode and Manager Martin stated that they had several offices that he knew of, including Lufkin, Jasper, and Livingston. Director Zimmerman commented that he like the local presence.

After a short discussion Director Turner made motion to allow Manager Martin to engage Axley & Rode for the 2015 annual financial audit. Treasurer Rogers seconded the motion. The motion passed unanimously.

6. At the discretion of the President, the Board may adjourn into closed session pursuant to Texas Open Meeting Act, Texas Government Code, Chapter 551.071: At 9:42, in accordance with Texas Open Meeting Act, Chapter 551.071, President Glenn adjourned the regular meeting of the Southeast Texas Groundwater Conservation District and convened a closed session.

At 10:19 a.m. President Glenn announced the end of the closed session. At 10:20 he again called to order the regular meeting of the Southeast Texas Groundwater Conservation District.

7. <u>Discussion and possible action regarding GMA 14 and DFCs</u>: Manager Martin reviewed two items he wanted the Board to take into consideration regarding DFCs and regional water planning. The first document, Item 7(b) of the monthly meeting materials, was an email from the TWDB by way of Kathy Turner Jones of the Lone Star GCD, with an amended table for the TERS report.

Manager Martin explained that at the request of a concerned citizen who attends Lone Star GCD board meetings, the TWDB revised TERS Table 1. The revised table includes two addition columns that split out the total TERS volumes by confined and unconfined volumes. Manager Martin stated that, as he understands it, the total volume of the confined portion of the Gulf Coast Aquifer would have to be pumped to meet the recommendations that the City of Conroe et al., are suggesting who want more water made available. Manager Martin pointed out that until Marvin Jones spoke this morning the amount being suggested was 5% of the TERS, and that Mr. Jones' recommendation of 2% was new. Nonetheless, according to the email from Larry French of the TWDB the confined portion of the aquifer averages only 0.4% of the total volume. Manager Martin explained that he spoke with GMA 14 consultant Bill Mullican who stated that what this meant was that by pumping all of the confined portion of the aquifer, 100% of the head pressures would be removed. He continued to explain that if that were to occur, existing wells would be reduced in capability/capacity, pumps would have to be lowered, larger pumps would need to be utilized, and additional wells may have to be drilled to make up for lost capacities.

The second document, Item 7(c), is a report that had been brought to his attention while attending the TAGD groundwater conference in August. The report, dated October 12, 2011, includes information on the estimated recharge and estimated maximum sustainable pumping volumes. Manager Martin stated that currently GMA 14 is using/planning for the use of over 1 million acre feet of water per year and the report shows that the annual recharge is estimated to be just under 675,000 acre feet per year. The report also indicates that estimated maximum sustainable pumping volume was only 402,000 acre feet per year.

Manager Martin recommended taking Attorney Stover's advice that the Board wait on taking any further action on the DFCs until after the 90 day comment period ended on October 4, 2015, which is several days before the next regularly scheduled Board meeting. He stated that he would be sure the Board would have all submitted comments included in next month's meeting materials and that it would be prudent to have any/all the documents available to review before any action is taken.

8. <u>Discussion and possible action regarding the abandoned well located on Meadow Wood Rd in Silsbee, TX</u>: Manager Martin reviewed the situation regarding the abandoned well. He recommend that the Board act on Attorney Stover's recommendation to have a title search completed on the tract of land where the well is located to see if the owner of the property could be located.

After a short discussion, Director McMillon made motion to allow Manager Martin to engage Hooks Title to perform the title search. Vice President Fussell seconded the motion. The motion passed unanimously.

- 9. <u>Manager's Report, to include: Jasper County Courthouse Annex update, TAGD Groundwater Summit, website update, B&L Water Well Service update, and drought conditions:</u> Manager Martin briefly reviewed the information in his Manager's Report including recent events related to the inspection of a well remediated by B&L Water Well Service.
- 10. <u>Establish date, time and place of next meeting</u>: President Glenn stated that the next regularly scheduled meeting is October 8, 2015. Manager Martin stated that a public hearing may be required for a non-exempt well application and, if so, would begin the October meeting at 9:00 a.m.
- 11. <u>Meeting adjourned</u>: At 10:50 a.m. President Glenn adjourned the regular meeting of the Southeast Texas Groundwater Conservation District.

Public Hearing:

(For a detailed record of the proceeding please refer to the audio recording of this hearing.)

- 1. Open public hearing: At 9:04 a.m. President Glenn brought to order the Public Hearing regarding the Non-Exempt Permit Application of Daniel Ayres. President Glenn asked Manager Martin to conduct a roll call, and a quorum was confirmed with 9 Directors present and four absent. At approximately 9:07 Director Meek arrived bringing the total number of Directors present to 10.
- 2. Receive public comment: President Glenn greeted all in attendance and introduced the Board of Directors. He then asked Manger Martin if proper notice had been provided for the public hearing regarding the Ayres application. Manager Martin provided exhibits (1 4) documenting the noticing of the hearing. He stated that there was a minor issue however, and that four of the property owners who were required to receive the notice by mail, as required by District Rule, were inadvertently missed. He stated that this meant that the hearing could only focus on the Drilling and Operating Permits as those requirements were met. The Transfer Permit requirements were not met and would have to be taken up at a future date.

President Glenn then asked who in attendance was opposed the Ayres permit request. Manager Martin provided three additional exhibits (5-7), which are written notices in opposition to the permit. After discussion the follow parties were accepted as have standing in the Ayres permit request:

Daniel Ayres
Paul Hitt, Jr.
Doy Lee Grace

Conley Todd Sandra Taraba Jeff Walker Rebecca Hudson William Mouhot Frances Malone

Manager Martin gave a brief description of the proposed well and its proposed capacities. The applicant, Mr. Ayres, provided some background information regarding the project then asked his hydrologist, William Turner, to provide additional technical information regarding the project. Mr. Turner provided information regarding the expected impact of the proposed well on the surrounding area and nearby water wells.

At 9:45 a.m. Attorney Stover requested a short recess, which was granted by President Glenn. At 10:00 the hearing resumed.

After discussion, an evidentiary hearing was set for November 12, 2015 to begin at 9:00 a.m.

3. <u>Close public hearing</u>: President Glenn adjourned the Public Hearing on the Non-Exempt Permit Application of Daniel Ayres at 10:25 a.m.

Regular Board Meeting:

- 1. <u>Call to order</u>: At 10:33 a.m. President Glenn called to order the regular meeting of the Southeast Texas Groundwater Conservation District. President Glenn then asked Manager Martin to conduct roll call for the regular meeting. A quorum was confirmed with 10 Directors present and 3 Directors absent.
- 2. <u>Public comment (Comments are restricted to 3 minutes with a total of all comments limited to 30 minutes)</u>: President Glenn asked if anyone present wished to make a public comment. President Glenn noted that only one member of public remained in attendance after the adjournment of the public hearing. Mr. Steven Black identified himself as a representative of the Evadale paper mill and stated that he was only in attendance to take notes in Director Turner's absence.
- 3. <u>Discussion and possible action to approve the minutes of the September 10, 2015</u>

 <u>Board meeting</u>: President Glenn asked if anyone had any questions or comments regarding the September 10, 2015 meeting minutes. No comments were made. Director Zimmerman made motion to approve the minutes of the September 10, 2015 meeting as presented. Director Bean seconded the motion. The motion passed unanimously.
- 4. <u>Discussion and possible action on the October Treasurer's Reports and approval of payables presented</u>: In Treasurer Rogers' absence, Manager Martin gave a thorough review of the District's October Treasurer's Report. He reviewed each of the District's account balances, the monthly payables, and expected FNB operating account balance after the October payables have been paid. He also commented on the P&L Budget vs. Actual Report, indicating everything looked good, that the District's income is above what has been projected, and that the expenses are below expected through September.

Director Bean made motion to approve the Treasurer's Report and payables as presented. Director Boone seconded the motion. The motion passed unanimously.

- 5. Presentation of the District's 3rd Quarter, 2015 Investment Report: Manager Martin reviewed the 3rd Quarter Investment Report including all beginning balances, ending balances, interest earned, interest rates, and combined total of all the funds. Manager Martin pointed out a minor typographic error just above the account totals portion of the report which wrongly indicated that the totals were for the 2nd quarter, 2015. He also noted that \$225,000 of the investment funds have been designated the "building fund" and \$10,000 has been designated for GMA 14 planning.
- 6. <u>Discussion and possible action regarding Daniel Ayres' request for drilling, operating, and transfer permits for a proposed new well to be located 1063 C.R. 2076 Newton, TX 75966</u>: No action was taken on this item at this time due to the pending evidentiary hearing set for November 12, 2015.
- 7. At the discretion of the President, the Board may adjourn into closed session pursuant to Texas Open Meeting Act, Texas Government Code, Chapter 551.071 and 551.074: This topic was moved to after Item 8 of the agenda due to Attorney Stover's schedule and need to leave in order to attend an emergency meeting elsewhere.

At 11:14 a.m., in accordance with Texas Open Meeting Act, Chapter 551.074, President Glenn adjourned the regular meeting of the Southeast Texas Groundwater Conservation District and convened a closed session to discuss the annual performance review of Manager Martin.

At 11:30 a.m. President Glenn announced the end of the closed session and again called to order the regular meeting of the Southeast Texas Groundwater Conservation District.

- 8. <u>Discussion and possible action to adopt the District's 2016 budget, as presented or with any amendments made at the time of the meeting</u>: After a brief discussion, Director Zimmerman made motion to approve the budget as presented and to provide a \$2,500 bonus to Manager Martin, to be included in an amended 2015 budget. Manager Martin stated that he had recently discussed amending the 2015 budget with Treasurer Rogers and that he would include the bonus in an amended 2015 budget to be considered at the next meeting. Director Bean seconded the motion. The motion passed unanimously.
- 9. <u>Discussion and possible action regarding GMA 14 and DFCs</u>: Manager Martin began reviewing the documents associated with GMA 14's proposed DFCs starting with the documents that had been previously provided to the Board at the previous meeting, including all the documents associated with Marvin Jones' comments and the R.W. Harden report. He then discussed his response to the R.W. Harden report stating that two items were of particular interest: first, the comment that subsidence in the Jasper Layer is not a concern according to the USGS/HAGM, and secondly, calculations of the proposed 1% for the Chicot and Evangeline and 2% of the Jasper based on the TERS.

Manager Martin then explained that the District has received some additional comments from Mr. Wade Oliver and Mr. Van Kelley from Intera Geoscience. He explained that Items 9h and 9i were presentations that had been given in person on September 17, 2015 at the Lone Star GCD DFC public hearing and was provided to our district in written format.

Then Manager Martin explained that the District received an additional written comment from Thornhill Group, but that it had been received on October 5, 2015, one day after the end of the 90 day comment period. Manager Martin reviewed and explained that in many ways Mr. Thornhill's comments were similar to Mr. Jones' and Mr. Harden's, but that he also emphasized several other issues, including but not limited to: reverse engineering, rebuttal to comments provided by Intera Geoscience, and the subsidence DFCs included for the Bluebonnet GCD.

Manager Martin pointed out Items 9 and 9(2) and stated that these were a Summary of Public Comments Received that are required to be produced to GMA 14. He stated that Item 9 did not include the comments received from Thornhill Group due to having been received after the 90 day period. He then stated that Item 9(2), a Summary of Public Comments Received, included the Thornhill Group comments.

Manager Martin asked Attorney Stover to provide his recommendation as to whether or not the comments received after the 90 day deadline should be included. Attorney Stover recommended to the Board that there would be no harm including them and recommended that they be included.

President Glenn asked if action and a motion is required. Attorney Stover stated the he thought it appropriate for the Board to consider approving the Summary of Public Comments Received, including the Thornhill Group written comments, and that the Board empower Manager Martin to move forward with adopting GMA 14's proposed DFCs at the GMA level and to allow for flexibility, at Manager Martin's discretion, if something else arises. Vice President Fussell made motion to approve the recommendation made by Attorney Stover. Director McMillon seconded the motion. The motion passed unanimously.

- 10. <u>Discussion and possible action regarding the abandoned well located on Meadow Wood Rd in Silsbee, TX</u>: Manager Martin stated that although the title search was run, very little new information was provided. He pointed out that there is an easement on the site with the Grantor and Grantee being the same person. Manager Martin recommended no action on this item at this time to allow for further research.
- Manager's Report, to include: Region I WPG; B&L Water Well Service update, and drought conditions: Manger Martin explained that B&L was nearing the end of it's one year period to plug and/or repair the wells that had been improperly completed. He stated that he hoped to have in the next month or two a thorough review of all of the wells that have been plugged and/or repaired by B&L. He asked if anyone had any problem with allowing B&L additional time. No one objected.

Manager Martin stated that a "walk through" was scheduled for the remodeled office on Friday. He also stated that it was still not known when the District would be able to move back into the remodeled office.

- 12. <u>Establish date, time and place of next meeting</u>: The next scheduled meeting will be on November 12, 2015 beginning with the previously discussed evidentiary hearing regarding the Ayres permit request.
- 13. <u>Meeting adjourned</u>: At 11:36 a.m. President Glenn adjourned the regular meeting of the Southeast Texas Groundwater Conservation District.

Roger Fussell Vice President

Date: November 12, 2015

Appendix C

Correspondence from Kevin Patteson, Texas Water Development Board, to Mike Turco, Harris-Galveston Subsidence District, approving the updated Houston Area Groundwater Model as the Official Groundwater Availability Model for the Northern Segments of the Gulf Coast Aquifer System.

February 18, 2014

Mr. Mike Turco General Manager Harris Galveston Subsidence District 1660 West Bay Area Blvd. Friendswood, TX 77546

Re: Approval of Houston Area Groundwater Model as the Official Groundwater Availability Model for the Northern Segment of the Gulf Coast Aquifer System

Dear Mr. Turco,

I am approving the request, transmitted in a letter dated April 15, 2013, from Mr. Ron Neighbors of the Harris-Galveston Subsidence District to Mr. Larry French of the Texas Water Development Board (Attachment 1), to designate the Houston Area Groundwater Model as the official groundwater availability model of the Northern Segment of the Gulf Coast Aquifer System. This action is pursuant to the provisions of Texas Water Code Section 16.012 (l) and is based on our technical evaluation of the Houston Area Groundwater Model compared to the existing groundwater availability model (Northern Gulf Coast Groundwater Availability Model). My staff has conducted this evaluation considering the technical requirements of joint planning and establishment of desired future conditions for the aquifers of Groundwater Management Area 14. I am also including documentation of the technical analysis (Attachment 2), as well as the comments of various groundwater stakeholders (Attachment 3) and TWDB responses to the comments (Attachment 4).

I appreciate the thoughtful and rigorous reviews that commenters have performed with respect to the Houston Area Groundwater Model. My staff agrees with a number of the technical issues that have been raised but note that most of these issues are also valid with respect to the existing groundwater availability model for the northern segment of the Gulf Coast Aquifer System. My staff will retain these technical comments and consider them when the TWDB performs future upgrades or improvements on the model.

By copy of this letter I am also informing the groundwater conservation districts in Groundwater Management Area 14 and the regional water planning groups of this action.

Letter to Mr. Mike Turco February 18, 2014

Page 2

Please contact Mr. Larry French (512-463-5067) of my staff if you have any questions.

Sincerely,

Kevin Patteson

Executive Administrator

THIS PAGE INTENTIONALLY LEFT BLANK	
Groundwater Mana	agement Area 14

Groundwater Management Area 14

Significant Activity Review, Status Update, and Remaining Milestones As of April 3, 2016

April 24, 2013

- Briefed on results from the recently concluded Houston Area Groundwater Model project.
- Briefed on changes made to the joint-planning process as a result of passage of Senate Bill 660 in 2011.

May 22, 2013

- Texas Water Development Board (TWDB) briefed Groundwater Water Management Area 14 (GMA 14) regarding ongoing technical review of recently completed Houston Area Groundwater Model (HAGM) for possible consideration as the official TWDB Groundwater Availability Model.
- Approval for execution of professional services contracts with consultants for execution of the joint-planning process.

June 26, 2013

- TWDB briefed GMA 14 on status of technical review of recently completed Houston Area Groundwater Model (HAGM).
- Briefed on a comparison between GAM Run 10-023 utilizing the TWDB adopted Northern Gulf Coast Groundwater Availability Model (2003) during the first round of joint planning and the recently completed Houston Area Groundwater Model (HAGM).

September 18, 2013

- Discussion of draft results from the Houston Area Groundwater Model (HAGM) under review by TWDB.
- Briefing and consideration of aquifer uses or conditions, including conditions that differ substantially from one geographic area to another in GMA 14, as required by Texas Water Code 36.108 (d)(1).
- Briefing and consideration of water supply needs and water management strategies included in the 2012 Texas State Water Plan, as required by Texas Water Code 36.108 (d)(2).

January 29, 2014

Posted meeting canceled due to hazardous travel conditions (ice storm).

March 4, 2014

Posted meeting canceled due to hazardous travel conditions (ice storm).

April 30, 2014

- U.S. Geological Survey briefed GMA 14 on the approach, conceptual model development, model calibration, and review process for the Houston Area Groundwater Model (HAGM).
- TWDB briefed GMA 14 on TWDB approval of the HAGM as the official Groundwater Availability Model for the Northern Gulf Coast Aquifer System.
- Briefed on results from HAGM GAM Run #1 and discussion on approach and process for HAGM GAM Run #2.
- Discussion of draft statements of desired future conditions (DFCs) resulting from HAGM GAM Run #1.

June 24, 2014

- Discussion and approval of aquifers to be designated as non-relevant for the purpose of joint planning.
- TWDB briefed GMA 14 on completion of reports regarding total estimated recoverable storage (TERS).
- Briefed on results from HAGM GAM Run #2.
- Discussion of draft statements of desired future conditions (DFCs) resulting from HAGM GAM Run #2.
- Briefing and consideration of hydrological conditions, including for each aquifer in the management area, total estimated recoverable storage, average annual recharge, inflows, and discharge, as required by Texas Water Code 36.108(d)(3).
- Briefing and consideration of environmental impacts, including impacts on spring flow and other interactions between groundwater and surface water, as required by Texas Water Code 36.108(d)(4).
- Briefing and discussion of the impacts of draft proposed DFCs on subsidence, as required by Texas Water Code Chapter 36.108(d) (5).

September 23, 2014

- Briefing and consideration of the socioeconomic impacts of draft proposed DFCs, as required by Texas Water Code 36.108(d) (6).
- Briefing and consideration of the impact on the interests and rights in private property, as required by Texas Water Code 36.108(d) (7).

- Briefing and discussion of administrative procedures under consideration by GMA 14.
- TWDB Board Member Beck Bruun provided overview of current activities at the TWDB.

November 18, 2014

- Consideration and approval of administrative procedures, with recognition of progress by GMA 14 to date.
- Briefing and consideration of the feasibility of achieving draft proposed DFCs, as required by Texas Water Code 36.108(d) (7).
- Consideration and approval of DFC option resulting from HAGM GAM Run #2 as a potential candidate for proposal and adoption by the Member Districts in accordance with Section 3.03 of the adopted administrative procedures.

May 27, 2015

• Consideration and approval of DFC option resulting from HAGM Run #2 as a candidate for adoption as a proposed DFC to be further reviewed in consideration of the nine statutory factors listed in Texas Water Code Section 36.108(1-9) and in accordance with Section 3.04 of the administrative procedures adopted by GMA 14.

June 24, 2015

 Consideration and approval of DFC option resulting from HAGM Run #2 for the Gulf Coast Aquifer System in GMA 14 as the proposed DFCs in accordance with Texas Water Code Section 36.108 (d) and (d-2) and in accordance with Section 3.05 of the administrative procedures adopted by GMA 14.

July 2 – 6, 2015

 Information considered by GMA 14 throughout current round of joint planning was distributed and made available to GCDs in GMA 14 and on the Lone Star GCD webpage for public review.

July 6 – October 3, 2015

• The 90-day public comment period for proposed DFCs occurred. Each GCD held a public hearing on the proposed DFCs relevant to the individual GCD in accordance with requirements included in Texas Water Code Section 36.108 (d-2). During the public comment period, each GCD made available in the GCD office a copy of the proposed DFCs and all supporting materials such as documentation of factors considered under Texas Water Code Section 36.108 (d) and the groundwater availability model results.

October 4 – 28, 2015

• After the individual public hearings, each GCD compiled for consideration at the next joint planning meeting a summary of relevant comments received along with suggested revisions to the proposed DFCs, and the basis for the revisions.

October 28, 2015

• GMA 14 meeting for District Representatives to consider summary reports submitted by each of the GCDs in GMA 14 and consider any proposals for alternative DFCs. After agreement to a few editorial and non-substantive revisions, GMA 14 District Representatives directed contracted consultants to prepare a draft Explanatory Report for review and comment by the GMA 14 District Representatives. Ultimately, the DFCs must be adopted as a resolution by a two-thirds vote of all the District Representatives. The District Representatives shall produce a final desired future conditions explanatory report for the management area and submit to the TWWDB and each GCD in the management area, including proof that notice was posted for the joint planning meeting, a copy of the resolution, and a copy of the explanatory report.

January 2, 2016

• Draft Explanatory Report provided to GMA 14 District Representatives for review and comment. This review and revision process, as of April 3, 2016, is ongoing.

Remaining efforts

- In an upcoming (to be scheduled) meeting of GMA 14 District Representatives, posted in accordance with the requirements of Chapter 551, Government Code, desired future conditions shall be adopt by resolution by 2/3 vote of all GCDs in GMA 14.
- After submission of the adopted DFCs including the explanatory report to the TWDB, then the TWDB will review for administrative completeness and then conduct execution of the Northern Gulf Coast GAM to calculate estimates of modeled available groundwater for GMA 14. This process at the TWDB may take from 6 – 8 months.
- In accordance with Texas Water Code Section 36.108 (d-4), as soon as possible after a GCD receives the adopted final DFC resolution and explanatory report, the GCD shall adopt the DFCs in the resolution and explanatory report that apply to the GCD.

Groundwater Mana	agement Area 14

RESOLUTION FOR THE APPROVAL OF DESIRED FUTURE CONDITIONS FOR ALL AQUIFERS IN GROUNDWATER MANAGEMENT AREA 14

Whereas, pursuant to Section 35.004 of the Texas Water Code, the Texas Water Development Board ("TWDB") has designated groundwater management areas that, together, cover all major and minor aquifers in the state; and

Whereas, each groundwater management area was designated with the objective of providing the most suitable area for the management of groundwater resources; and

Whereas, through Title 31, Section 356.21 of the Texas Administrative Code, the TWDB has designated the area encompassing all of Austin, Brazoria, Chambers, Fort Bend, Galveston, Grimes, Hardin, Harris, Jasper, Jefferson, Liberty, Montgomery, Newton, Orange, Polk, San Jacinto, Tyler, Walker, Waller, and Washington counties as Groundwater Management Area No. 14 ("GMA 14"); and

Whereas, GMA 14 includes all or portions of areas subject to groundwater regulation by Bluebonnet Groundwater Conservation District (Austin, Grimes, Walker, and Waller counties), Brazoria County Groundwater Conservation District (Brazoria County), Lone Star Groundwater Conservation District (Montgomery County), Lower Trinity Groundwater Conservation District (Polk and San Jacinto counties), and Southeast Texas Groundwater Conservation District (Hardin, Jasper, Newton, and Tyler counties) (the "Member Districts"); and

Whereas, the Member Districts are authorized by Chapter 36, Texas Water Code, to engage in joint planning activities for the coordinated management of the aquifers located in GMA 14, and in that regard, shall establish desired future conditions ("DFCs") for the relevant aquifers within GMA 14; and

Whereas Fort Bend Subsidence District (Fort Bend County), Harris-Galveston Subsidence District (Galveston and Harris counties), and other stakeholders within GMA 14 from Chambers County, and Washington County also contributed to the development of DFCs for GMA 14; and

Whereas, Section 36.108 of the Texas Water Code requires the Member Districts in GMA 14 to consider groundwater availability models and other data or information for the management area and vote on a proposal for the adoption of DFCs for each relevant aquifer within GMA 14 by May 1, 2016; and

Whereas, the Member Districts within GMA 14 secured hydrogeologic and engineering consulting services to provide technical support in their efforts to establish requisite DFCs; and

Whereas, in developing the proposed DFCs for the relevant aquifers within GMA 14, the Member Districts in GMA 14 considered the nine statutory factors set forth in Section 36.108(d) of the Texas Water Code:

- aquifer uses or conditions within the management area, including conditions that differ substantially from one geographic area to another,
- the water supply needs and water management strategies included in the state water plan,
- hydrological conditions, including for each aquifer in the management area the total estimated recoverable storage as provided by the executive administrator, and the average annual recharge, inflows, and discharge,
- other environmental impacts, including impacts on spring flow and other interactions between groundwater and surface water,
- the impact on subsidence,
- socioeconomic impacts reasonably expected to occur,
- the impact on the interests and rights in private property, including ownership and the rights of management area landowners and their lessees and assigns in groundwater as recognized under Section 36.002,
- the feasibility of achieving the desired future condition, and
- any other information relevant to the specific desired future conditions; and

Whereas, pursuant to Section 36.108(d-2), the Member Districts also considered in their development of proposed DFCs the balance between the highest practicable level of groundwater production and the conservation, preservation, protection, recharging, and prevention of waste of groundwater and control of subsidence in the management area; and

Whereas, the Member Districts used this information to developed proposed DFCs for the portions of the northern segment of the Gulf Coast Aquifer that occurs within the bounds of GMA 14; and

Whereas, TWDB conducted an evaluation of the Houston Area Groundwater Model ("HAGM") and adopted it as the updated Northern Gulf Coast Groundwater Availability Model ("GAM"); and

Whereas, the Members Districts conducted a model run of the updated Northern Gulf Coast GAM specifically identified as GAM Run 2 for the purpose of evaluating drawdown in the Northern Gulf Coast Aquifer; and

Whereas, the TWDB has prepared a report for GAM Task 10-052 MAG for the Carrizo-Wilcox Aquifer; and

Whereas, the TWDB has prepared a report for GAM Task 10-053 MAG for the Queen City Aquifer; and

Whereas, the TWDB has prepared a report for GAM Task 10-054 MAG for the Sparta Aquifer; and

Whereas, the TWDB has prepared a report for GAM Task 10-055 MAG for the Yegua-Jackson Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-30 MAG for the Brazos River Alluvium Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-31 MAG for the Navasota River Alluvium Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-32 MAG for the San Bernard River Alluvium Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-33 MAG for the San Jacinto River Alluvium Aquifer; and

Whereas, the TWDB has prepared a report for Aquifer Assessment Task 10-34 MAG for the Trinity River Alluvium Aquifer; and

Whereas, during joint meetings noticed and conducted pursuant to Section 36.108(e) of the Texas Water Code, the Member Districts considered GAMs and other data and information relevant to the development of DFCs for GMA 14, including input and comments from stakeholders within GMA 14; and

Whereas, the Member Districts find that all notice requirements for a meeting, held this day, to take up and consider the approval of the proposed DFCs as described herein for GMA 14 have been, and are, satisfied; and

Whereas, Texas Water Code Section 36.0015(b), as amended by House Bill 200 during the 84th Texas Legislature states that "(b) In order to provide for the conservation, preservation, protection, recharging, and prevention of waste of groundwater, and of groundwater reservoirs or their subdivisions, and to control subsidence caused by withdrawal of water from those groundwater reservoirs or their subdivisions, consistent with the objectives of Section 59, Article XVI, Texas Constitution, groundwater conservation districts may be created as provided by this chapter. Groundwater conservation districts created as provided by this chapter are the state's preferred method of groundwater management in order to protect property rights, balance the conservation and development of groundwater to meet the needs of this state, and use the best available science in the conservation and development of groundwater through rules developed, adopted, and promulgated by a district in accordance with the provisions of this chapter"; and

Whereas, the Member Districts find that the proposed DFCs provided herein for establishment are each merited and necessary for the effective and prudent management of groundwater resources within GMA 14, and have otherwise been developed in accordance with, and do satisfy the obligations imposed by, Chapter 36 of the Texas Water Code and all other applicable laws of the State of Texas.

Now, therefore, be it resolved by the Member Districts of GMA 14 that the following DFCs are each hereby established:

Formations of the Gulf Coast Aquifer

DFCs for the Gulf Coast Aquifer are hereby adopted, as documented by and incorporating herein GAM Run 2, at two scales, which do not differ substantively in their application; the first being for GMA 14 in its entirety, and also, to better facilitate the management and conservation of groundwater resources at the individual groundwater conservation district level after considering the statutory criteria set forth under Section 36.108(d), Water Code, on a county-by-county basis. DFCs for GMA 14 for the Gulf Coast Aquifer are as follows:

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 28.3 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 23.6 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 18.5 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 66.2 feet after 61 years.

Austin County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 39 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 76 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Austin County should not exceed approximately 2.83 feet by the year 2070.

Brazoria County (BCGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 27 feet after 61 years.

Chambers County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 32 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 30 feet after 61 years.

Grimes County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 5 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 5 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 6 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 52 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Grimes County should not exceed approximately 0.12 feet by the year 2070.

Hardin County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 21 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 27 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 29 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 89 feet after 61 years.

Jasper County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 23 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 41 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 46 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 40 feet after 61 years.

Jefferson County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 15 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 17 feet after 61 years.

Liberty County

• From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 27 feet after 61 years.

- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 29 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 25 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 120 feet after 61 years.

Montgomery County (LSGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 26 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately -4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately -4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 34 feet after 61 years.

Newton County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 35 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 45 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 44 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 37 feet after 61 years.

Orange County

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 14 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 16 feet after 61 years.

Polk County (LTGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 26 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 10 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 15 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 73 feet after 61 years.

San Jacinto County (LTGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 22 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 19 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 19 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 108 feet after 61 years.

Tyler County (STGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 42 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 35 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 30 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 62 feet after 61 years.

Walker County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 9 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 4 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 42 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Walker County should not exceed approximately 0.04 feet by the year 2070.

Waller County (BGCD)

- From estimated year 2009 conditions, the average draw down of the Chicot Aquifer should not exceed approximately 39 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 39 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 40 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 101 feet after 61 years.
- From estimated year 1890 conditions, the maximum subsidence in Waller County should not exceed approximately 4.73 feet by the year 2070.

Washington County

- From estimated year 2009 conditions, the average draw down of the Evangeline Aquifer should not exceed approximately 1 foot after 61 years.
- From estimated year 2009 conditions, the average draw down of the Burkeville confining unit should not exceed approximately 16 feet after 61 years.
- From estimated year 2009 conditions, the average draw down of the Jasper Aquifer should not exceed approximately 48 feet after 61 years.

Formations in Fort Bend, Galveston, and Harris counties

Groundwater Management Area 14 (GMA 14) efforts to determine DFCs is primarily an aquifer water-level based approach to describe the regional and local desires for the aquifer beneath them. The GMA process requires Groundwater Conservation Districts (GCDs) to determine the DFCs for the entire GMA, regardless of whether each county is included within a GCD. The Fort Bend Subsidence District (FBSD) and the Harris-Galveston Subsidence District (HGSD), operating in Fort Bend County and Harris and Galveston counties, respectively, regulate groundwater for the purpose of ending land surface subsidence within their jurisdiction. They are not GCDs and operate considerably different from the typical GCD. Therefore, in an official context these three counties are "unrepresented" but the GCDs within GMA-14 must still determine the DFC for these counties.

Both FBSD and HGSD have participated in an unofficial role to aid the GCDs within GMA-14 with their evaluation of Fort Bend, Galveston and Harris County information. The groundwater pumpage within these three counties even though regulated is still greater than the sum of all other counties within GMA-14. FBSD and HGSD recognize that the projected groundwater pumpage from these three counties will impact the decisions of GMA-14 throughout a large portion of the area. FBSD and HGSD have provided considerable historical and projected groundwater pumpage data and details of regulations to assist GMA-14 in incorporating these counties in the overall GMA-14 DFCs. FBSD and HGSD cannot however, present DFCs for these three counties in terms of aquifer water-level changes over time. The FBSD and HGSD regulations do not specifically address water-levels nor do they designate a specific pumping limit, rather the regulations are based on limitations of groundwater as a percentage of total water demand. The percentage of groundwater to total water demand is decreased over time, as total water demand increases.

The goal of both FBSD and HGSD is to end land surface subsidence that is caused by man's pumpage of groundwater. There is a clearly established link between the over-pumpage of groundwater and land surface subsidence. The DFCs within the aquifer beneath Fort Bend, Galveston, and Harris counties has no easily defined relationship to water-levels. The DFC for FBSD and HGSD is the reduction and halting of the compaction of clay layers within the aquifer caused by the over-pumpage of groundwater. Stated more simply, the DFC for these three counties is that future land surface subsidence be avoided. That stated, HGSD and FBSD have adopted regulations, most recently in 2013, that require the reduction of

groundwater pumpage and the conversion to alternate water sources, while balancing with the realistic ability of the permittees to achieve compliance with these regulations. This effort was accomplished with the aid of computer models and information specific to the missions of FBSD and HGSD and outside of the revised Northern Gulf Coast GAM (NGCGAM) adopted by the TWDB.

Within HGSD, from central to southeastern Harris County and all of Galveston County (Regulatory Areas 1 and 2), virtually all permittees have achieved compliance with previous and current HGSD regulations. Subsidence has been halted and water-levels within the aquifer have risen dramatically in these areas. However, in northern and western areas of Harris County (Regulatory Area 3), the HGSD regulations have allowed groundwater pumpage to continue until the required reductions in 2010, 2025, and 2035. With these scheduled reductions in groundwater pumpage, subsidence will slow dramatically and even be halted with water-levels stabilizing and in later years rising.

Within FBSD, from central to northern and eastern Fort Bend County (Regulatory Area A), the regulations call for reductions of groundwater pumpage in 2014/2016, and 2025. Similar to HGSD's Regulatory Area 3, subsidence within FBSD Regulatory Area A will slow dramatically and even be halted with water-levels stabilizing and in later years rising.

In both HGSD and FBSD, because of the percentage based approach to regulations, groundwater pumpage will increase until scheduled reductions in milestone years (ex: 2010, 2014/2016, 2025, and 2035). In between milestone years, groundwater pumpage will increase with the assumed increase in total water demand from an assumed increase in population. In order to demonstrate the DFC of these three counties using water-level changes, the area of previous groundwater-to-alternative water conversions must be separated from future conversions AND each annual time step must be depicted.

The HGSD and FBSD have submitted to GMA-14 their current regulations and projected groundwater pumpage projections through the year 2070. This data has been divided into the grid cells/layers relative to the NGCGAM and utilized by the GCDs in development of their DFCs.

Groundwater pumpage within GMA-14 from Fort Bend, Galveston, and Harris counties is regulated by FBSD and HGSD, non GCD governmental agencies (the only GMA in Texas with this occurrence) and the missions of HGSD and FBSD are vastly different from GCDs and do not fit well with a water-level designed DFC process). The groundwater pumpage projections developed in recognition of the HGSD and FBSD regulatory plans have been utilized without adjustment by GMA14 in the DFC process. Therefore, the DFCs adopted by GMA-14 are consistent with the HGSD and FBSD regulatory plans.

Carrizo Sand Aquifer

Grimes County (BGCD)

• The portion of the Carrizo Sand Aquifer occurring in Grimes County is declared non-relevant.

Walker County (BGCD)

• The portion of the Carrizo Sand Aquifer occurring in Walker County is declared non-relevant.

Queen City Aquifer

Grimes County (BGCD)

• The portion of the Queen City Aquifer occurring in Grimes County is declared non-relevant..

Walker County (BGCD)

• The portion of the Queen City Aquifer occurring in Walker County is declared non-relevant..

Sparta Aquifer

Grimes County (BGCD)

• The portion of the Sparta Aquifer occurring in Grimes County is declared non-relevant..

Walker County (BGCD)

• The portion of the Sparta Aquifer occurring in Walker County is declared non-relevant.

Yegua-Jackson Aquifer

Grimes County (BGCD)

The portion of the Yegua Jackson Aquifer occurring in Grimes County is declared non-relevant..

Jasper County (STGCD)

The portion of the Yegua-Jackson occurring in Jasper County is declared non-relevant.

Newton County (STGCD)

The portion of the Yegua-Jackson occurring in Newton County is declared non-relevant.

Polk County (LTGCD)

The portion of the Yegua-Jackson occurring in Polk County is declared non-relevant.

Tyler County (STGCD)

The portion of the Yegua-Jackson occurring in Tyler County is declared non-relevant.

Walker County (BGCD)

The portion of the Yegua Jackson Aquifer occurring in Walker County is declared non-relevant..

Washington County

• The portion of the Yegua Jackson Aquifer occurring in Washington County is declared non-relevant..

River Alluvium Aquifers

Austin County (BGCD)

- The portion of the Brazos River Alluvium occurring in Austin County is declared non-relevant.
- The portion of the San Bernard River Alluvium occurring in Austin County is declared non-relevant.

Grimes County (BGCD)

- The portion of the Brazos River Alluvium occurring in Grimes County is declared non-relevant.
- The portion of the Navasota River Alluvium occurring in Grimes County is declared non-relevant.

Walker County (BGCD)

- The portion of the San Jacinto River Alluvium occurring in Walker County is declared non-relevant.
- The portion of the Trinity River Alluvium occurring in Walker County is declared non-relevant.

Waller County (BGCD)

The portion of the Brazos River Alluvium occurring in Walker County is declared non-relevant.

Washington County

• The portion of the Brazos River Alluvium occurring in Washington County is declared non-relevant.

And it is so ordered and passed this 29th day of April, 2016.

SUBJECT: Groundwater Availability

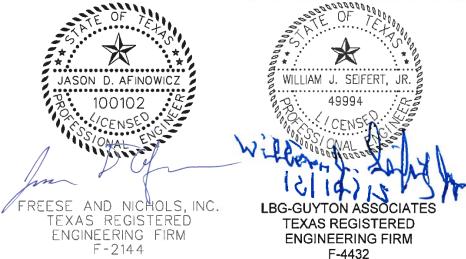

Model Run Summary for Groundwater Management

Area 14, Northern Gulf

Coast Aquifer

DATE: 2015/12/11

PROJECT: LSD13339

Groundwater Management Area 14 (GMA 14) is completing the development of Desired Future Conditions (DFCs) for the aquifers within its region. GMA 14 is comprised of five groundwater conservation districts: Bluebonnet Groundwater Conservation District (BGCD), Brazoria County Groundwater Conservation District (BGCD), Lower Trinity Groundwater Conservation District (LTGCD), and Southeast Texas Groundwater Conservation District (STGCD). Each district, along with other interlocal planning partners, participated in the DFC development and model review processes described in this document.

Description of Desired Future Conditions

GMA 14 has prepared a summary of DFCs for two aquifers comprising the Gulf Coast Aquifer and the Yegua-Jackson Aquifer. This model submittal comprises the GMA's evaluation of the Northern Gulf Coast Aquifer pursuant to that goal. DFCs by layer, county, and the entirety of GMA 14 are contained below in *Table 1*.

Modeling Approach

The proposed pumping scenario was evaluated in MODFLOW-2000 using the Northern Gulf Coast Groundwater Availability Model (GAM) approved by TWDB on February 18, 2014 and formally referred to as the Houston Area Groundwater Model (HAGM). This model was reviewed by TWDB and approved as the Northern Gulf Coast GAM on February 18, 2014.

The updated Northern Gulf Coast GAM covers an area spanning 38 counties in southeast Texas. Flow is simulated in four layers of the model, generally comprising the Chicot Aquifer, the Evangeline Aquifer, the Burkeville Confining Unit, and the Jasper Aquifer. These layers are shown below in *Figure 1*. The model simulates hydrogeologic conditions in these four layers over a period from a predevelopment condition in 1891 through 2009. The northwestern boundaries for each layer are the northwestern extent of the up dip outcrop segments. The downdip limit of freshwater in each aquifer was chosen as the southeastern boundary of each layer. A no-flow boundary was selected for this line. The southwestern and northeastern boundaries we drawn to generally coincide with the occurrence of the Lavaca and Sabine Rivers, respectively, and were simulated with the use of a no-flow boundary due to the location of groundwater divides in these areas. Finally, a no-flow boundary was also set at the base of the Jasper, as the brackish water located in the underlying Catahoula Aquifer impedes communication between this layer and the Jasper. The MODFLOW General-Head Boundary (GHB) package was used for simulating recharge and discharge in all model layers.

Pumpage in the base model was derived from a number of sources, including the Harris-Galveston Subsidence District (HGSD), Fort Bend Subsidence District (FBSD), LSGCD, TWDB, and the San Jacinto River Authority (SJRA). The model was simulated under transient conditions from 10,000 years prior to 1891. A total of 78 stress periods of various lengths were used to simulate the years from 1891 through 2009. These stress periods are illustrated below in *Figure 2* and *Table 2*.

Figure 2 – Total Groundwater Withdrawals by Stress Period, 1891-2009

¹A 10,000-year transient period was used without withdrawals for model stability.

Calibration of the model was conducted through iterative trial-and-error adjustment of selected model input data until measured and estimated field conditions could be replicated to a reasonable degree. Additional details of the model configuration and approach are shown in *Hydrogeology and Simulation of Groundwater Flow and Land-Surface Subsidence in the Northern Part of the Gulf Coast Aquifer System, Texas, 1891-2009* (USGS, 2012).

Pumping during the predictive period of the model (following 2009) was incorporated into the model from various sources using information provided by individual districts throughout GMA 14. These sources include:

- TWDB GAM Run 10-023 during the first phase of DFC development conducted in 2010,
- Pumpage incorporated into the HAGM as part of the Regional Groundwater Update Project (RGUP),
- Regulatory limits imposed by the LSGCD regulatory plan,

In addition, data from the HAGM and GAM Run 10-023 were used as the bases for the horizontal and vertical distribution of pumpage in the model. *Attachment A* summarizes the target pumpage for predictive period stress periods simulated in the Northern Gulf Coast GAM.

Model Output Analysis

Model output was analyzed based on cell county assignments from the TWDB model grid for the Northern Gulf Coast Aquifer dated February 3, 2014 (GLFC N GRID POLY020314).

Cell-by-cell drawdown results for each formation were geographically assigned to counties based on the TWDB model grid county assignments. The cell-by-cell drawdowns in each county were averaged to produce the overall county drawdowns; cells that went dry during the simulated period were not included in this calculation.

Results of the analysis are shown below in *Table 3*, including target pumpage and drawdown over the predictive period by county and layer.

Table 3 – Simulated Pumpage and Resulting Drawdown

Country	Formation			Mode	l Pumpage (Ac-	-Ft/Yr)			Average Drawdown
County	Formation	2010	2020	2030	2040	2050	2060	2070	2009-2070

MODFLOW Package

A complete MODFLOW package for the model simulation is included as an attachment to this memorandum. This includes the following items:

- 00BaseFiles
 - o Input
 - HAGM.2013.bas Basic Package for NGC GAM
 - HAGM.2013.bcf Block-Centered Flow Package for NGC GAM
 - HAGM.2013.sip Strongly Implicit Package for NGC GAM
 - HAGM.2013.sub Subsidence and Aquifer-System Compaction Package for NGC GAM
 - HAGM.2013_139.dis Discretization File for NGC GAM

GAM Run Summary for GMA 14, Northern Gulf Coast Aquifer 2015/12/11 Page 8 of 9

- HAGM.2013_139.ghb General-Head Boundary Package for NGC GAM
- Well
 - Rev20140610_SP1_thru_SP139.wel Modified Well Package used for simulation described in this memorandum
- Runs
 - HAGM_rev20140610.nam Input and output file names for simulation described in this memorandum
 - HAGM_rev20140610.oc Output Control Option used for simulation described in this memorandum

WATER SUPPLY NEEDS AND STRATEGIES

September 18, 2013

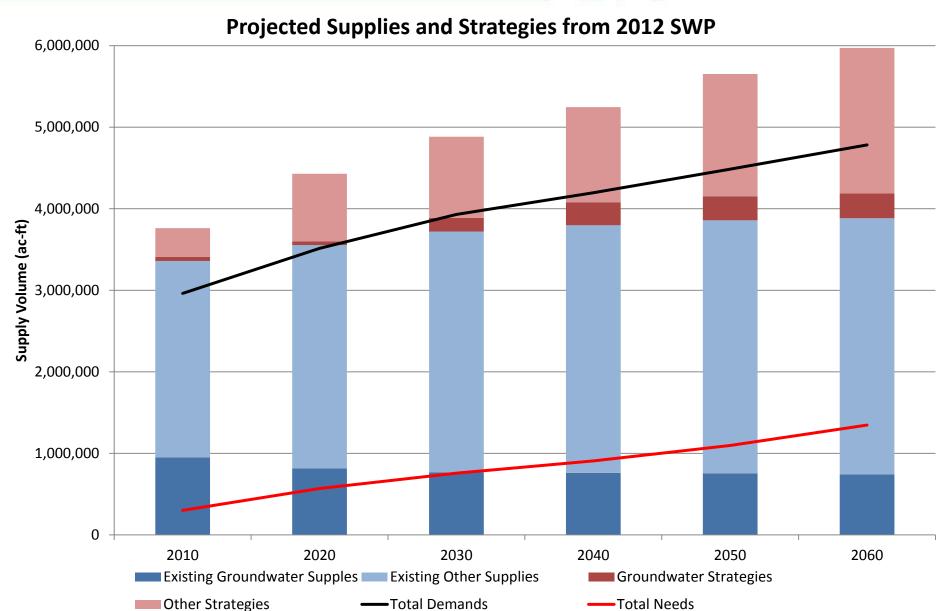

Water Supply Needs and Strategies

- Water Supply Needs and Strategies
 - 2012 State Water Plan
 - Year 2010 to 2060
 - Summarized by counties

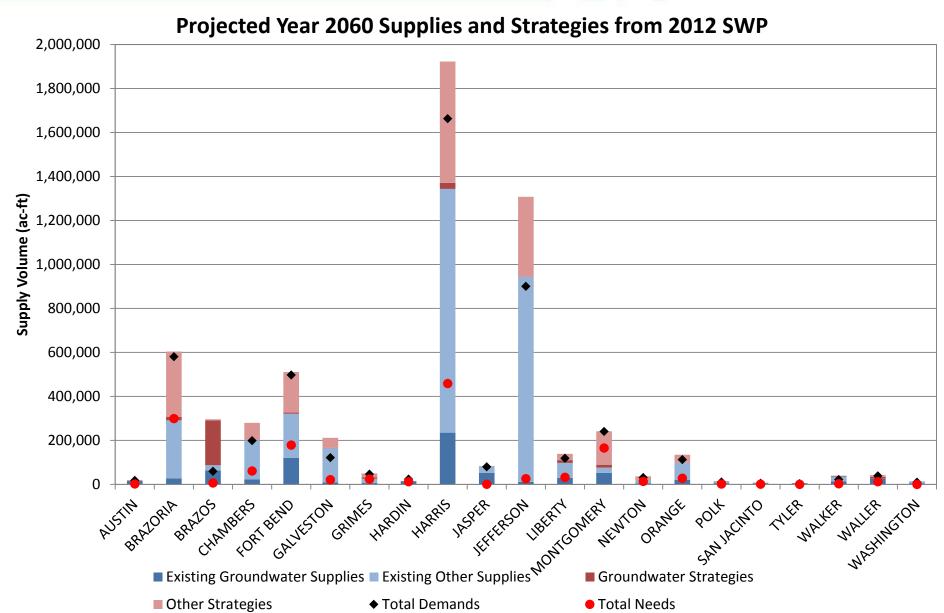

Water Supply Needs and Strategies

Water Supply Needs and Strategies

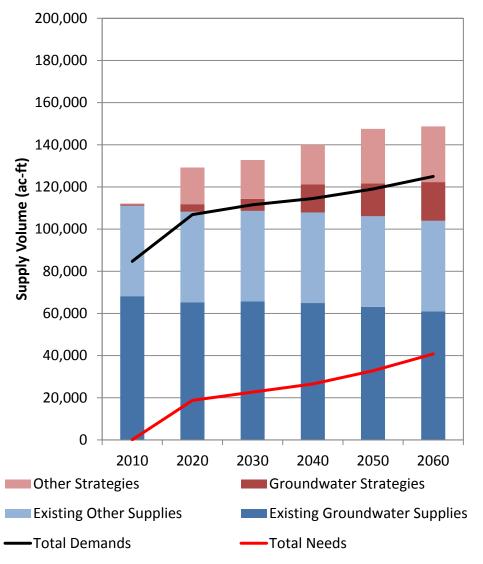

Water Supply Needs and Strategies

Strategies from 2012 SWP

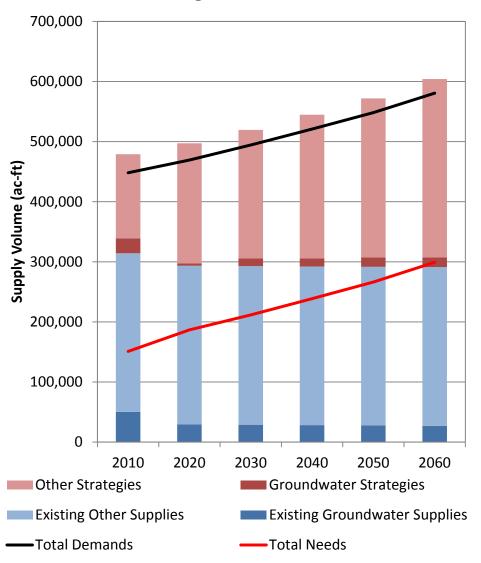

- Expanded use of groundwater
- Purchase water from City of Bryan
- Conservation
- Raise level of Gibbons Creek
 Reservoir
- Wastewater Reuse

Water Supply Needs and Strategies

Brazoria County GCD Projected Supplies and Strategies from 2012 SWP

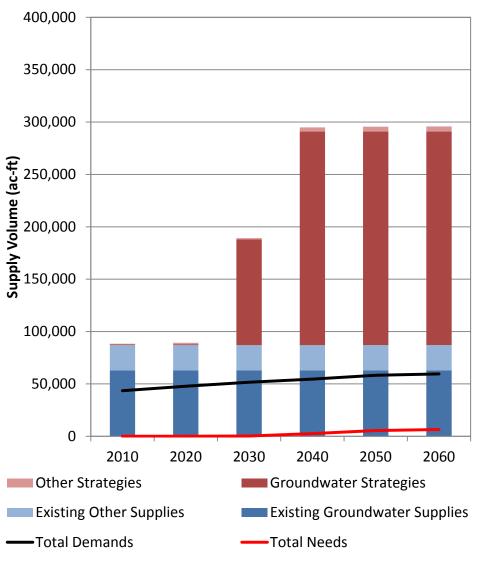

- Expanded use of groundwater
- Allens Creek Reservoir
- Brazoria, DOW, and GCWA
 OCRs
- Conservation
- Freeport Desal
- Interruptible Irr. Supplies
- Supply reallocation
- Wastewater reclamation for municipal irrigation

Water Supply Needs and Strategies

Brazos Valley GCD Projected Supplies and Strategies from 2012 SWP

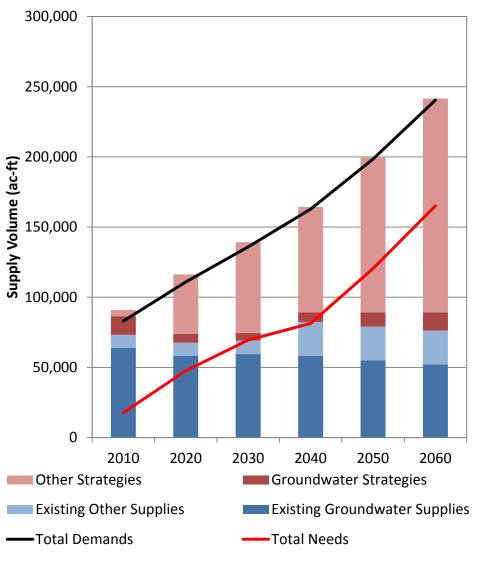

- Brazos GW project to DWU and NTMWD
- Expanded use of groundwater
- Purchase water from City of Bryan
- BRA System Operation permit
- Municipal conservation
- Wastewater reuse

Water Supply Needs and Strategies

Lone Star GCD Projected Supplies and Strategies from 2012 SWP

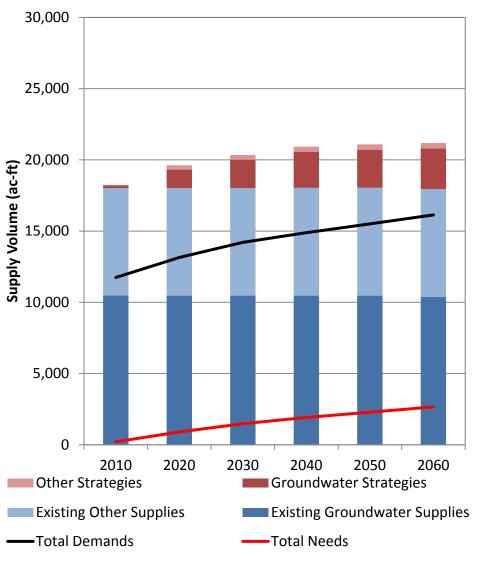

- Expanded use of groundwater
- Interim groundwater use
- MC MUD 8 and 9 reuse
- Municipal conservation
- SJRA WRAP
- TRA to SJRA Contract
- Wastewater reclamation for municipal irrigation

Water Supply Needs and Strategies

Lower Trinity GCD Projected Supplies and Strategies from 2012 SWP

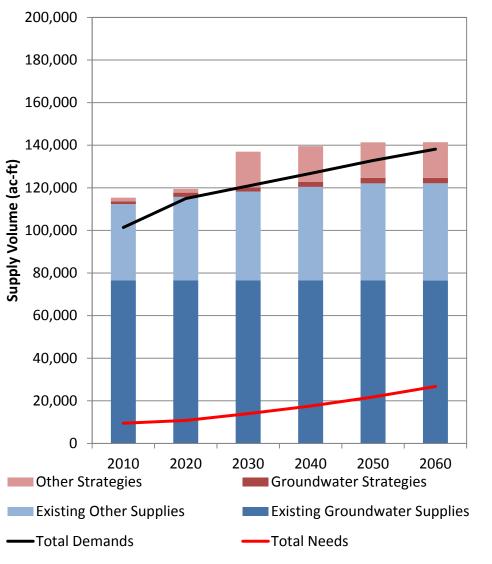

- Expanded use of groundwater
- Municipal conservation

Water Supply Needs and Strategies

Southeast Texas GCD Projected Supplies and Strategies from 2012 SWP

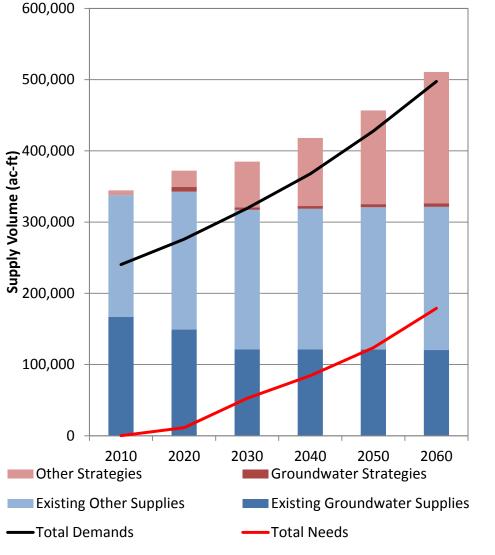

- Expanded use of groundwater
- Overdrafting
- Purchase water from provider

Water Supply Needs and Strategies

Fort Bend Subsidence District Projected Supplies and Strategies from 2012 SWP

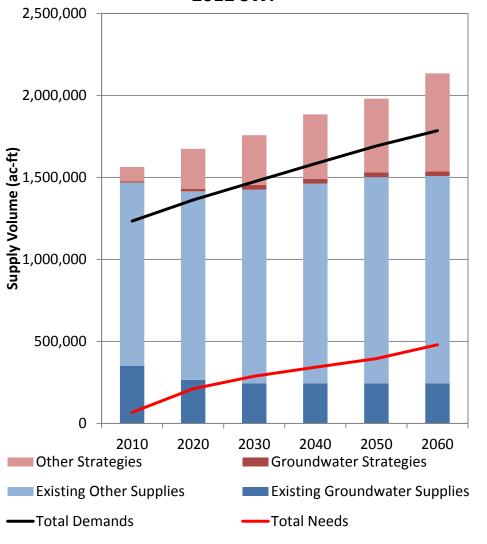

- Expanded use of groundwater
- Allens Creek Reservoir
- BRA System Operations permit
- Fort Bend OCR
- Conservation
- Supply reallocation
- TRA to Houston contract
- Wastewater reclamation for municipal irrigation
- GRPs

Water Supply Needs and Strategies

Harris-Galveston Subsidence District
Projected Supplies and Strategies from
2012 SWP

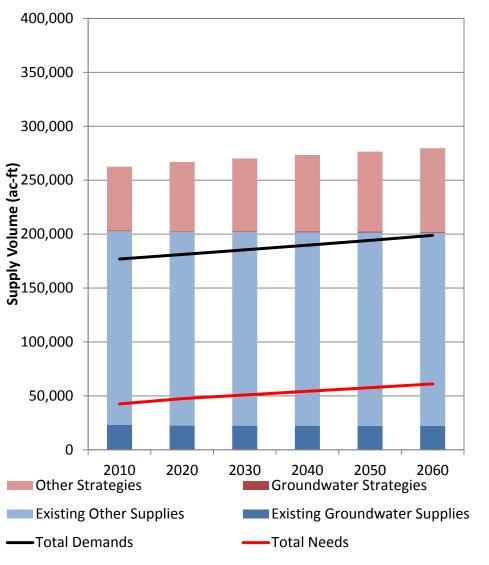

- Expanded use of groundwater
- Allens Creek Reservoir
- Conservation
- Contract expansions
- Houston indirect reuse
- Supply reallocation
- TRA to Houston contract
- Wastewater reclamation for municipal irrigation
- Wastewater reuse for industry
- GRPs

Water Supply Needs and Strategies

Chambers County Projected Supplies and Strategies from 2012 SWP

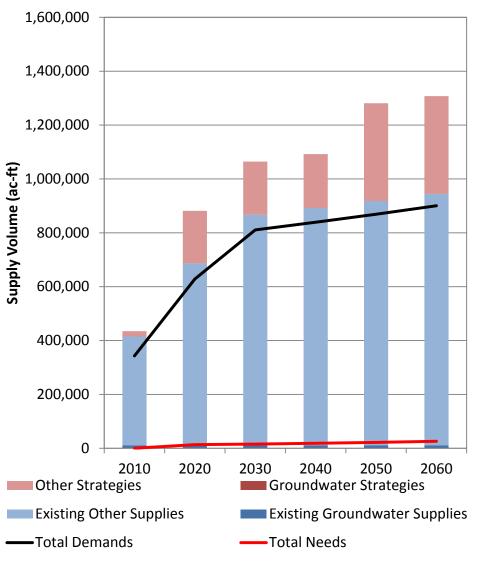

- Expanded use of groundwater
- CLCND West Chambers system
- Conservation
- New contracts
- Supply reallocation

Water Supply Needs and Strategies

Jefferson County Projected Supplies and Strategies from 2012 SWP

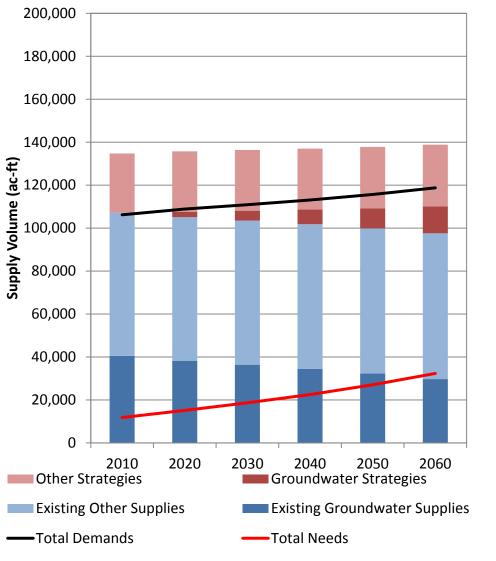

- Expanded use of groundwater
- Permit amendment for Sam Rayburn
- Purchase water from provider
- Reallocation of flood storage
- Saltwater barrier conjunctive operation
- Wholesale customer conservation

Water Supply Needs and Strategies

Liberty County Projected Supplies and Strategies from 2012 SWP

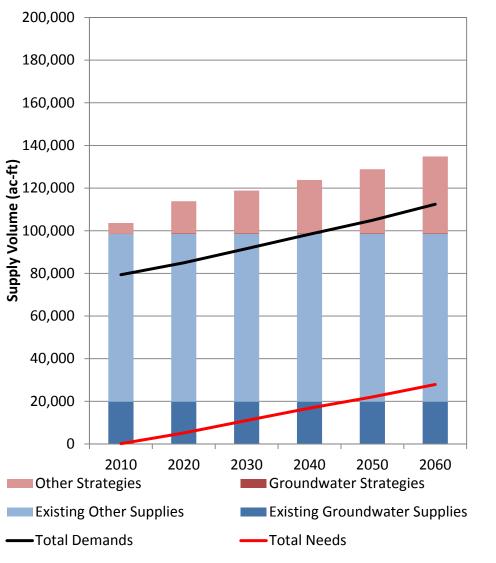

- Expanded use of groundwater
- Conservation
- Supply reallocation

Water Supply Needs and Strategies

Orange County Projected Supplies and Strategies from 2012 SWP

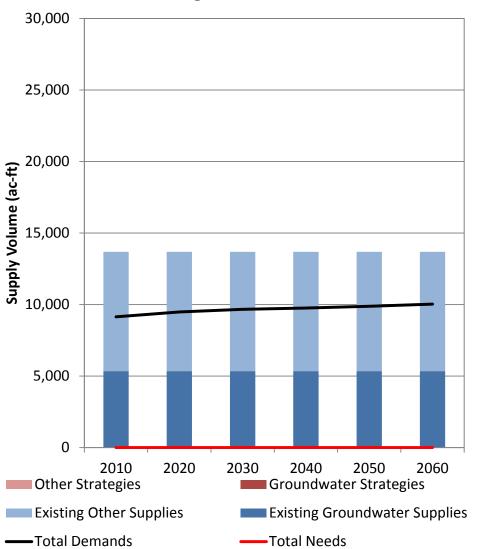

- Expanded use of groundwater
- Overdrafting
- Purchase water from provider

Water Supply Needs and Strategies

Washington County Projected Supplies and Strategies from 2012 SWP

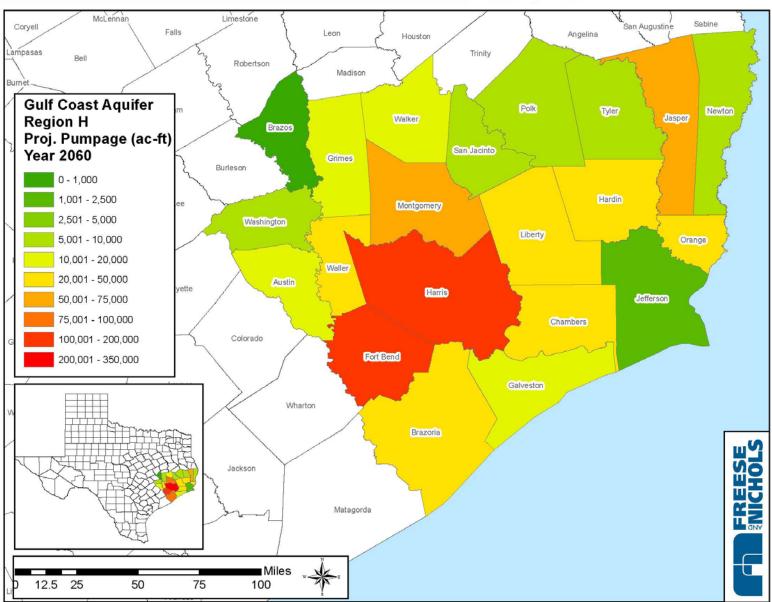

Major Strategies

None

Water Supply Needs and Strategies

Explanatory Report

HYDROLOGICAL CONDITIONS

June 24, 2014

Hydrological Conditions

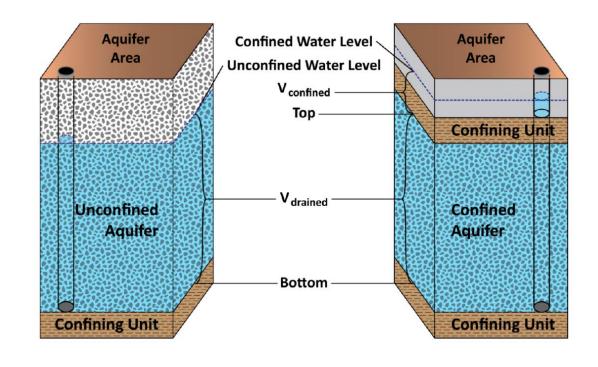

Hydrological Conditions

- "hydrological conditions, including for each aquifer in the management area the total estimated recoverable storage as provided by the executive administrator, and the average annual recharge, inflows, and discharge;" TWC 36.108 (d) (3)
- Location
- Water Surface
- Long-Term Trends
- Water Budget
 - Recharge
 - Discharge to Surface
 - Inflow/Outflow
- Total Estimated Recoverable Storage (from TWDB)

Hydrological Conditions

- Total Estimated Recoverable Storage
- TWDB assumed between 25 and 75 percent of total volume could be removed by pumping

Hydrological Conditions

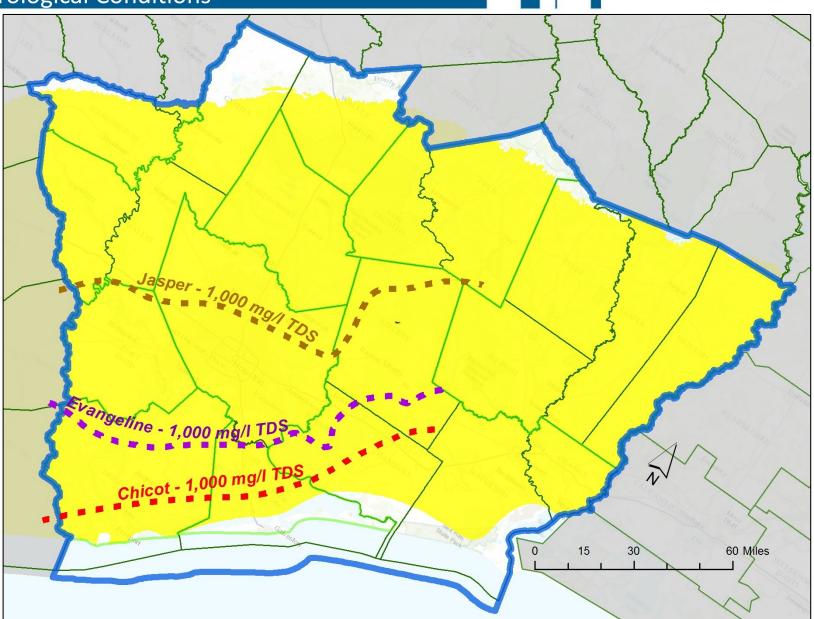

Gulf Coast Aquifer

- Hydrogeology and Simulation of Groundwater
 Flow and Land-Surface Subsidence in the Northern
 Part of the Gulf Coast Aquifer (USGS, Rev. 2012)
- Northern Gulf Coast GAM Run
- TWDB GAM Task 13-037

June 09, 2014

EXECUTIVE SUMMARY:

Texas Water Code, §36.108 (d) (Texas Water Code, 2011) states that, before voting on the proposed desired future conditions for a relevant aquifer within a groundwater management area, the groundwater conservation districts shall consider the total estimated recoverable storage as provided by the executive administrator of the Texas Water Development Board (TWDB) along with other factors listed in §36.108 (d). Texas Administrative Code Rule §356.10 (Texas Administrative Code, 2011) defines the total estimated recoverable storage as the estimated amount of groundwater within an aquifer that accounts for recovery scenarios that range between 25 percent and 75 percent of the porosity-adjusted aquifer volume.

This report discusses the methods, assumptions, and results of an analysis to estimate the total recoverable storage for the Carrizo-Wilcox, Queen City, Sparta, Yegua-Jackson, Gulf Coast, and Brazos River Alluvium aquifers in addition to water-bearing alluvial sediments determined as relevant by Groundwater Management Area 14 groundwater conservation districts for the San Bernard, Navasota, San Jacinto, and Trinity rivers within Groundwater Management Area 14. Tables 1 through 20 summarize the total estimated recoverable storage required by the statute. The total estimated recoverable storage values are for areas within the official extent of the aquifers (and other portions deemed relevant by the groundwater conservation districts) in Groundwater Management Area 14. In addition, areas that currently have adopted desired future conditions but may be declared to be non-relevant are included

² Contact information is for Roberto Anaya

as the total estimated recoverable storage values are needed for the associated explanatory report per Texas Administrative Code Rule §356.31 (b) (Texas Administrative Code, 2011).

DEFINITION OF TOTAL ESTIMATED RECOVERABLE STORAGE:

The total estimated recoverable storage is defined as the estimated amount of groundwater within an aquifer that accounts for recovery scenarios that range between 25 percent and 75 percent of the porosity-adjusted aquifer volume. In other words, we assume that only 25 to 75 percent of groundwater held within an aquifer can be removed by pumping.

The total recoverable storage was estimated for the portion of the aquifers within Groundwater Management Area 14 that lie within the official lateral aquifer boundaries as delineated by George and others (2011). If portions of aquifers outside these boundaries were defined as relevant in the resolution dated August 25, 2010, that adopted the current desired future conditions, then estimates of total recoverable storage reported here include these specific areas. Total estimated recoverable storage values may include a mixture of water quality types, including fresh, brackish, and saline groundwater, because the available data and the existing groundwater availability models do not permit the differentiation between different water quality types. The total estimated recoverable storage values do not take into account the effects of land surface subsidence, degradation of water quality, or any changes to surface water-groundwater interaction that may occur as the result of extracting groundwater from the aquifer.

METHODS:

To estimate the total recoverable storage of an aquifer, we first calculated the total storage in an aquifer within the official and/or relevant aquifer boundary. The total storage is the volume of groundwater removed by pumping that completely drains the aquifer.

Aquifers can be either unconfined or confined (Figure 1). A well screened in an unconfined aquifer will have a water level equal to the water level outside the well or in the aquifer. Thus, unconfined aquifers have water levels within the aquifers. A confined aquifer is bounded by low permeable geologic units at the top and bottom, and the aquifer is under hydraulic pressure above the ambient atmospheric pressure. The water level at a well screened in a confined aquifer will be above the top of the aquifer. As a result, calculation of

total storage is also different between unconfined and confined aquifers. For an unconfined aquifer, the total storage is equal to the volume of groundwater removed by pumping that makes the water level fall to the aquifer bottom. For a confined aquifer, the total storage contains two parts. The first part is the groundwater released from the aquifer when the water level falls from above the top of the aquifer to the top of the aquifer. The reduction of hydraulic pressure in the aquifer by pumping causes expansion of groundwater and deformation of aquifer solids. The aquifer is still fully saturated to this point. The second part, just like unconfined aquifer, is the groundwater released from the aquifer when the water level falls from the top to the bottom of the aquifer. Given the same aquifer area and water level drop, the amount of water released in the second part is much greater than the first part. The difference is quantified by two parameters: storativity related to confined aquifers and specific yield related to unconfined aquifers. For example, storativity values range from 10⁻⁵ to 10⁻³ for most confined aquifers, while the specific yield values can be 0.01 to 0.3 for most unconfined aquifers. The equations for calculating the total storage are presented below:

for unconfined aquifers

$$Total\ Storage = V_{drained} = Area \times S_v \times (Water\ Level - Bottom)$$

for confined aguifers

$$Total\ Storage = V_{confined} + V_{drained}$$

confined part

$$V_{confined} = Area \times [S \times (Water\ Level-Top)]$$
 or
$$V_{confined} = Area \times [S_S \times (Top-Bottom) \times (Water\ Level-Top)]$$

unconfined part

$$V_{drained} = Area \times [S_y \times (Top - Bottom)]$$

where:

- $V_{drained}$ = storage volume due to water draining from the formation (acre-feet)
- $V_{confined}$ = storage volume due to elastic properties of the aquifer and water(acre-feet)
- Area = area of aquifer (acre)
- Water Level = groundwater elevation (feet above mean sea level)

- Top = elevation of aquifer top (feet above mean sea level)
- Bottom = elevation of aquifer bottom (feet above mean sea level)
- S_v = specific yield (no units)
- S_s = specific storage (1/feet)
- S = storativity or storage coefficient (no units)

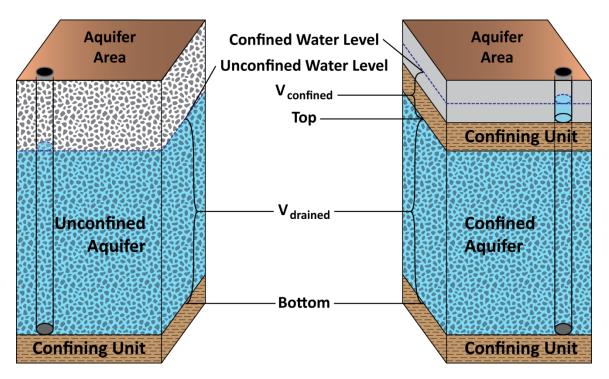

FIGURE 1. SCHEMATIC GRAPH SHOWING THE DIFFERENCE BETWEEN UNCONFINED AND CONFINED AQUIFERS.

As presented in the equations, calculation of the total storage requires data, such as aquifer top, aquifer bottom, aquifer storage properties, and water level. For the Carrizo-Wilcox, Queen City, Sparta, Yegua-Jackson, and Gulf Coast aquifers we extracted this information from existing groundwater availability model input and output files on a cell-by-cell basis.

For the Brazos River Alluvium Aquifer which does not have a groundwater availability model, we used an analytical approach. For each county, ArcMAP™ was used to estimate the Brazos River Alluvium Aquifer thickness (assuming base of the alluvium and land surface) and average water table depth (Shah and others, 2007; TWDB, 2013). Average Brazos River Alluvium Aquifer saturated thickness for each county was then calculated from average thickness minus average water table depth. Finally we estimated the total storage of the Brazos River

Alluvium Aquifer from average saturated thickness multiplied with area and an assumed specific yield value.

For the water bearing alluvial sediments determined as relevant for the San Bernard, Navasota, San Jacinto, and Trinity rivers, which do not have a groundwater availability model, we used an analytical approach. For each county, ArcMAP™ was used to calculate the acreage area for the delineated spatial extents of each of the river alluvia. The saturated thickness was then estimated based on water well and water-level data from the TWDB groundwater database for each of the acreage areas of the water bearing alluvial sediments determined as relevant (TWDB, 2011). Finally, we estimated the total storage for each of the river alluvia using average saturated thicknesses multiplied with associated areas and an assumed uniformly distributed specific yield values reported in the literature (Baker and others, 1974; Bradley, 2011; Cronin and Wilson, 1967; Johnson, 1967; Wilson, 1967).

The recoverable storage for each of the aquifers listed above was the product of its total storage and an estimated factor ranging from 25 percent to 75 percent.

PARAMETERS AND ASSUMPTIONS:

Carrizo-Wilcox, Queen City, and Sparta aquifers

- We used version 2.02 of the groundwater availability model for the central part of the Carrizo-Wilcox, Queen City, and Sparta aquifers to estimate the total recoverable storage for the Carrizo-Wilcox, Queen City, and Sparta aquifers. See Dutton and others (2003) and Kelley and others (2004) for assumptions and limitations of the groundwater availability model.
- This groundwater availability model includes eight layers which generally represent the Sparta Aquifer (Layer 1), the Weches Confining Unit (Layer 2), the Queen City Aquifer (Layer 3), the Reklaw Confining Unit (Layer 4), the Carrizo Formation (Layer 5), the Upper Wilcox Formation or Calvert Bluff Formation (Layer 6), the Middle Wilcox Formation or Simsboro Formation (Layer 7), and the Lower Wilcox Formation or Hooper Formation (Layer 8). To develop the estimates for the total estimated recoverable storage, we used Layer 1 (Sparta Aquifer), Layer 3 (Queen City Aquifer), and Layers 5 through 8 (Carrizo-Wilcox Aquifer system).

- The down-dip boundary of the model is based on the location of the Wilcox Growth Fault Zone, which is considered to be a barrier to flow (Kelley and others, 2004). This boundary is relatively deep and in the portion of the aquifer that is characterized as brackish to saline; consequently, the model includes parts of the formation beyond potable portions of the aquifer (Dutton and others, 2003). The groundwater in the official extent of the Carrizo-Wilcox, Queen City, and Sparta aquifers ranges from fresh to brackish in composition (Kelley and others, 2004).
- The groundwater availability model for the northern part of the Carrizo-Wilcox, Queen City, and Sparta aquifers was not considered for analysis because the active model area was more adequately covered by the overlap of the active model area for the central part of the Carrizo-Wilcox, Queen City, and Sparta aquifers.

Yegua-Jackson Aquifer and the Catahoula Formation portion of the Gulf Coast Aquifer System

- We used version 1.01 of the groundwater availability model for the Yegua-Jackson Aquifer to estimate the total recoverable storages of the Yegua-Jackson Aquifer. See Deeds and others (2010) for assumptions and limitations of the groundwater availability model.
- This groundwater availability model includes five layers which represent the outcrop section for the Yegua-Jackson Aquifer and the Catahoula Formation and other younger overlying units (Layer 1), the upper portion of the Jackson Group (Layer 2), the lower portion of the Jackson Group (Layer 3), the upper portion of the Yegua Group (Layer 4), and the lower portion of the Yegua Group (Layer 5). To develop the estimates for the total estimated recoverable storage in the Yegua-Jackson Aquifer, we used layers 1 through 5; however, we only used model cells in Layer 1 that represent the outcrop area of the Yegua-Jackson Aquifer.
- The down-dip boundary for the Yegua-Jackson Aquifer in this model was set to approximately coincide with the extent of the available geologic data, well beyond any active portion (groundwater use) of the aquifer (Deeds and others, 2010).
 Consequently, the model extends into zones of brackish and saline groundwater. The groundwater in the official extent of the Yegua-Jackson Aquifer ranges from fresh to brackish in composition (Deeds and others, 2010).

• For Jasper, Newton, Polk, Tyler, and Washington counties we used the official active areas of the groundwater availability model to estimate the total recoverable storage for the Yegua-Jackson Aquifer. However, for Grimes and Walker counties the desired future condition statement adopted on August 25, 2010,0 included confined and brackish confined areas outside of the official aquifer area. Geographic information for those areas was submitted with the desired future condition statement. We used that information in this assessment to estimate the total recoverable storage for Grimes and Walker counties for layers 2 through 5 which represent the confined parts of the Yegua-Jackson units.

Gulf Coast Aquifer System

- We used version 3.01 of the groundwater availability model for the northern portion of the Gulf Coast Aquifer system for this analysis. See Kasmarek (2013) for assumptions and limitations of the model.
- The model has four layers which represent the Chicot Aquifer (Layer 1), the Evangeline Aquifer (Layer 2), the Burkeville confining unit (Layer 3), and the Jasper Aquifer and parts of the Catahoula Formation in direct hydrologic communication with the Jasper Aquifer (Layer 4).
- The southeastern boundary of flow in each hydrogeologic unit of the model was set at the down-dip limit of freshwater (defined in this case to be up to 10,000 milligrams per liter of total dissolved solids; Kasmarek, 2013).

Brazos River Alluvium Aquifer

- The Brazos River Alluvium Aquifer is under water table conditions in most places (George and others, 2011).
- The thickness of the Brazos River Alluvium Aquifer is based on a U.S. Geological Survey electromagnetic and resistivity imaging project (Shah and others, 2007).
- Water levels are from the TWDB groundwater database
 http://www.twdb.texas.gov/groundwater/data/gwdbrpt.asp accessed in July 2013.
 The three latest years of water level data were used to estimate the average water table depth for each county.
- We used a specific yield value of 0.15 from Cronin and others (1967).

San Bernard River Alluvium

- The areal extent of the San Bernard River Alluvium within Austin County was calculated to be 2,792 acres (USGS and TWDB, 2006).
- Average saturated thickness of the water bearing alluvium determined as relevant was calculated to be 20 feet (Thorkildsen and Backhouse, 2011).
- We used a specific yield value of 0.15 (Wilson, 1967).

Navasota River Alluvium

- The areal extent of the Navasota River Alluvium within Grimes County was calculated to be 12,004 acres (USGS and TWDB, 2006).
- Based on water well and water-level data from the TWDB groundwater database near the confluence of the Navasota and Brazos Rivers the water bearing alluvium determined as relevant has an average saturated thickness of 32 feet (TWDB, 2011).
- We used a specific yield value of 0.15 (Baker and others, 1974; Bradley, 2011; Johnson, 1967).

San Jacinto River Alluvium

- The areal extent of the San Jacinto River Alluvium within Walker County was calculated to be 7,399 acres (USGS and TWDB, 2006).
- Based on water well and water-level data from the TWDB groundwater database the
 water bearing alluvium determined as relevant has an average saturated thickness of
 20 feet (TWDB, 2011).
- We used a specific yield value of 0.15 (Cronin and Wilson, 1967; Johnson, 1967).

Trinity River Alluvium

- The areal extent of the Trinity River Alluvium within Walker County was calculated to be 19,873 acres (USGS and TWDB, 2006).
- Based on water well and water-level data from the TWDB groundwater database the
 water bearing alluvium determined as relevant has an average saturated thickness of
 23 feet (TWDB, 2011).
- We used a specific yield value of 0.15 (Cronin and Wilson, 1967; Johnson, 1967).

RESULTS:

Tables 1 through 20 summarize the total estimated recoverable storage required by statute. The county and groundwater conservation district total storage estimates are rounded to two or three significant digits. Figures 2 through 11 indicate the extent of the groundwater availability models or aquifer boundaries deemed relevant by the groundwater conservation districts in Groundwater Management Area 14 for the Carrizo-Wilcox, Queen City, Sparta, Yegua-Jackson, Gulf Coast, and Brazos River Alluvium aquifers as well as the water bearing alluvial sediments determined as relevant by Groundwater Management Area 14 groundwater conservation districts for the San Bernard, Navasota, San Jacinto, and Trinity rivers.

Bluebonnet GCD	22,000	5,500	16,500
Total	22,000	5,500	16,500

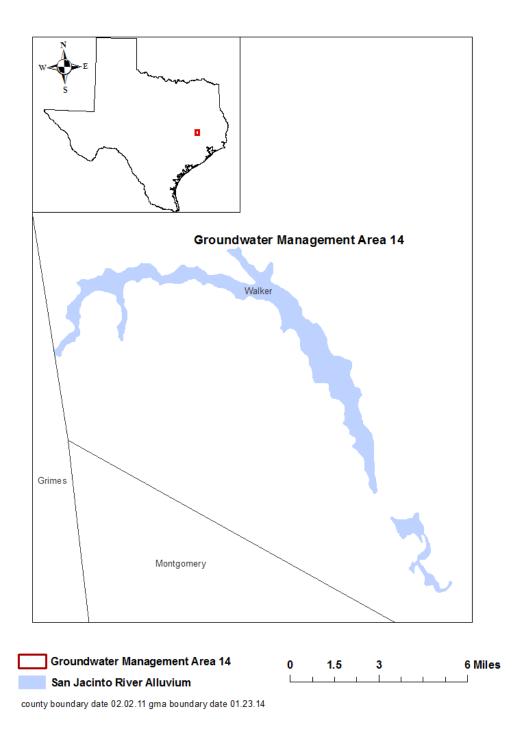

FIGURE 10. EXTENT OF THE SAN JACINTO RIVER ALLUVIUM DETERMINED AS RELEVANT IN WALKER COUNTY USED TO ESTIMATE TOTAL RECOVERABLE STORAGE (TABLES 17 AND 18) FOR THE SAN JACINTO RIVER ALLUVIUM DETERMINED AS RELEVANT WITHIN GROUNDWATER MANAGEMENT AREA 14.

TABLE 19. TOTAL ESTIMATED RECOVERABLE STORAGE BY COUNTY FOR THE TRINITY RIVER ALLUVIUM DETERMINED AS RELEVANT WITHIN GROUNDWATER MANAGEMENT AREA 14. COUNTY TOTAL ESTIMATES ARE ROUNDED TO TWO SIGNIFICANT DIGITS.

County	Total Storage (acre-feet)	25 percent of Total Storage (acre-feet)	75 percent of Total Storage (acre-feet)
Walker	69,000	17,250	51,750
Total	69,000	17,250	51,750

TABLE 20. TOTAL ESTIMATED RECOVERABLE STORAGE BY GROUNDWATER CONSERVATION DISTRICT FOR THE TRINTY RIVER ALLUVIUM DETERMINED AS RELEVANT WITHIN GROUNDWATER MANAGEMENT AREA 14. GROUNDWATER CONSERVATION DISTRICT TOTAL ESTIMATES ARE ROUNDED TO TWO SIGNIFICANT DIGITS.

Groundwater Conservation District (GCD)	Total Storage (acre-feet)	25 percent of Total Storage (acre-feet)	75 percent of Total Storage (acre-feet)
Bluebonnet GCD	69,000	17,250	51,750
Total	69,000	17,250	51,750

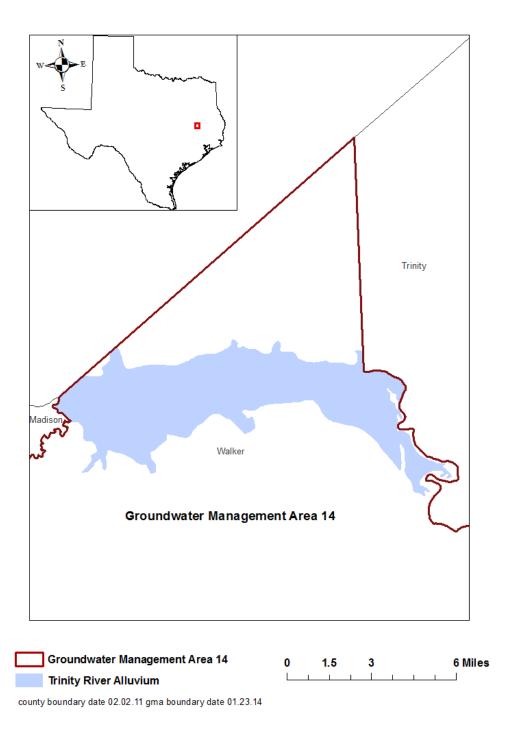

FIGURE 11. EXTENT OF THE TRINITY RIVER ALLUVIUM DETERMINED AS RELEVANT IN WALKER COUNTY USED TO ESTIMATE TOTAL RECOVERABLE STORAGE (TABLES 19 AND 20) FOR THE TRINITY RIVER ALLUVIUM DETERMINED AS RELEVANT WITHIN GROUNDWATER MANAGEMENT AREA 14.

LIMITATIONS

The groundwater models used in completing this analysis are the best available scientific tools that can be used to meet the stated objective(s). To the extent that this analysis will be used for planning purposes and/or regulatory purposes related to pumping in the past and into the future, it is important to recognize the assumptions and limitations associated with the use of the results. In reviewing the use of models in environmental regulatory decision making, the National Research Council (2007) noted:

"Models will always be constrained by computational limitations, assumptions, and knowledge gaps. They can best be viewed as tools to help inform decisions rather than as machines to generate truth or make decisions. Scientific advances will never make it possible to build a perfect model that accounts for every aspect of reality or to prove that a given model is correct in all respects for a particular regulatory application. These characteristics make evaluation of a regulatory model more complex than solely a comparison of measurement data with model results."

Because the application of the groundwater model was designed to address regional scale questions, the results are most effective on a regional scale. The TWDB makes no warranties or representations relating to the actual conditions of any aquifer at a particular location or at a particular time.

Groundwater Mana	agement Area 14

Explanatory Report

ENVIRONMENTAL IMPACTS

June 24, 2014

Environmental Impacts

- "other environmental impacts, including impacts on spring flow and other interactions between groundwater and surface water" TWC 36.108 (d) (4)
- Groundwater-Surface Water Interaction
- Spring Flow
- Source Varies by Aquifer
 - Gulf Coast: Available literature and studies
 - Carrizo: Central Carrizo-Wilcox GAM
 - Queen City: Central Carrizo-Wilcox GAM
 - Sparta: Central Carrizo-Wilcox GAM
 - Yegua-Jackson: Yegua-Jackson GAM

Environmental Impacts

Gulf Coast Aquifer

- NGC GAM does not include the "stream package" used to estimate groundwater and surface water interaction
- Groundwater and surface water interaction occurs based on USGS and TWDB studies
- LCRA studies show groundwater and surface water interaction limited to the shallow groundwater system and the river, similar conditions could occur in GMA-14

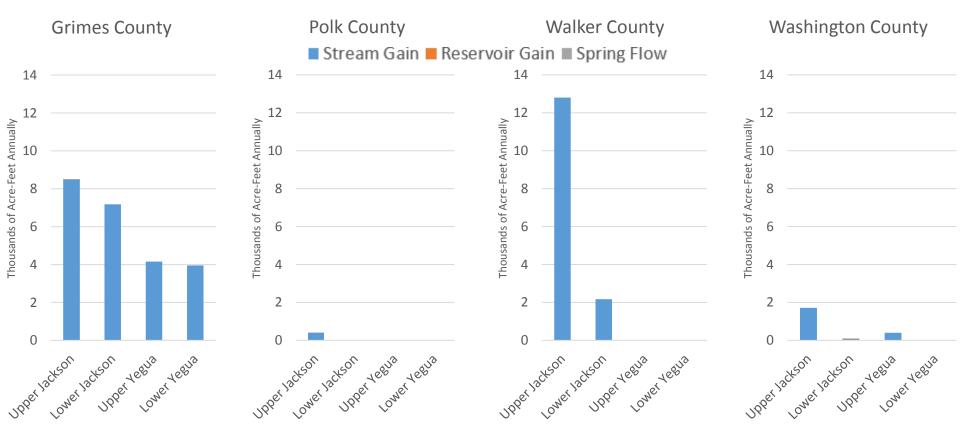

- Carrizo, Queen City, and Sparta Aquifers
 - Carrizo-Wilcox GAM
 - No outflow to streams, rivers, or springs within
 Grimes or Walker Counties

- Yegua-Jackson Aquifer
 - Substantial amount of total recharge to Yegua-Jackson stays in shallow groundwater system to become stream discharge
 - Discharge to streams occurs in Grimes, Polk,
 Walker and Washington Counties
 - Yegua-Jackson is classified as a minor aquifer

- Yegua-Jackson Aquifer
 - Includes Stream Gain, Reservoir Gain, and Spring Flow components in budget

Conroe, Texas

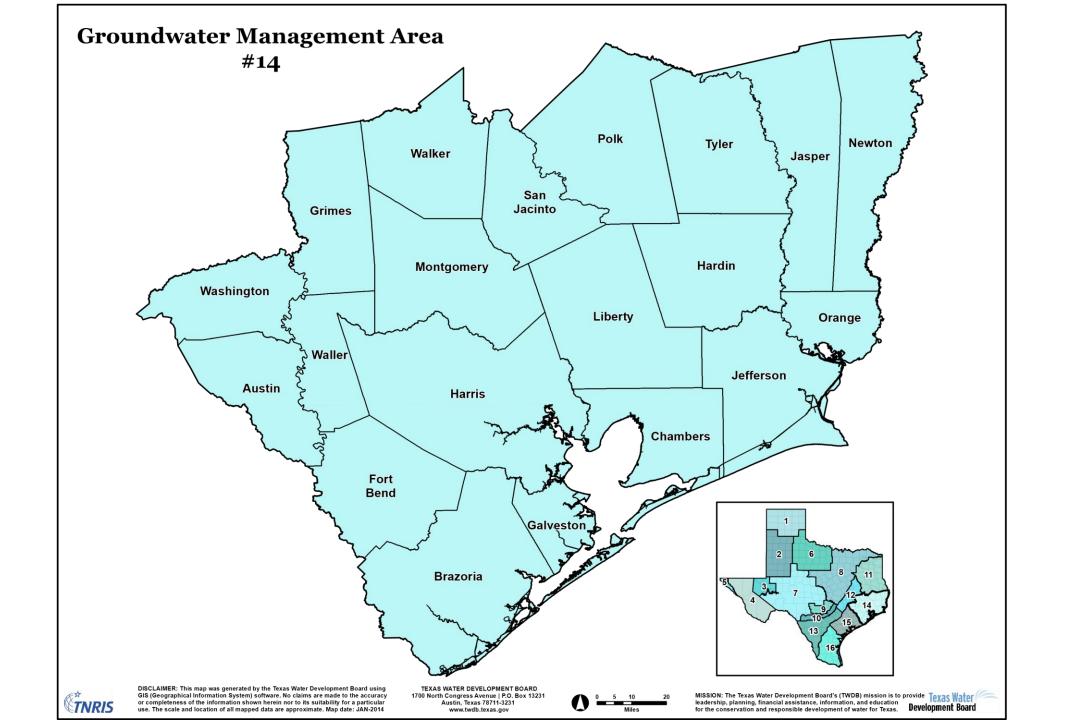

September 23, 2014

Today's Considerations

- TWC Section 36.108 (d) (6) socioeconomic impacts reasonably expected to occur
- TWC Section 36.108 (d) (7) impact on the interests and rights in private property

Socioeconomic Impacts and Water Planning in Texas – A Brief History

- Texas Water Code Chapter 16.051 (a) the board shall prepare, develop, formulate, and adopt a comprehensive state water plan that . . . shall provide for . . . further economic development (companion provision in TWC Chapter 16.053 (a, b) for regional water plans).
- Texas Administrative Code (TAC), Title 31, Chapter 357.7 (4)(A) states, "The executive administrator shall provide available technical assistance to the regional water planning groups, upon request, on water supply and demand analysis, including methods to evaluate the social and economic impacts of not meeting needs."

Socioeconomic Impacts and Water Planning in Texas – A Brief History (cont.)

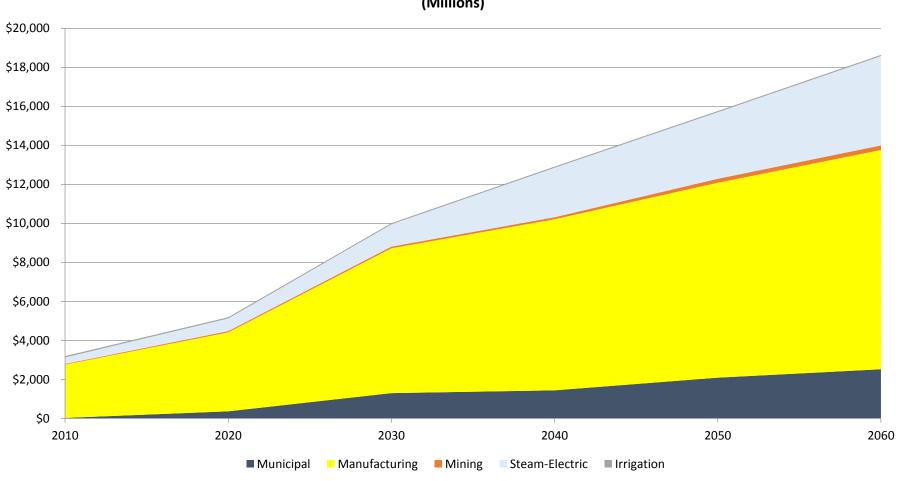

• TAC, Title 31, Chapter 357.40 (a) RWPs shall include a quantitative description of the socioeconomic impacts of not meeting the identified water needs pursuant to §357.33(c) of this title (relating to Needs Analysis: Comparison of Water Supplies and Demands).

Socioeconomic Impacts Analysis

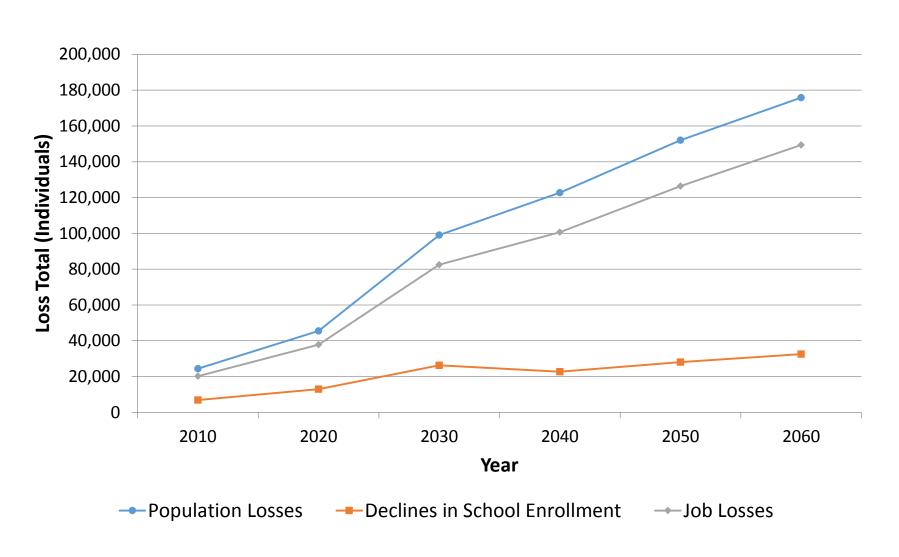

- Executed by TWDB at request of RWPGs
- Uses water supply needs from Regional Water Plan
- Point estimates of 1-year drought at 10-year intervals
- Analysis attempts to measure the impacts in the event that water user groups do not meet their identified water supply needs associated with a drought of record for one year.
- Multiple impacts examined
 - Sales, income, and tax revenue
 - Jobs
 - Population
 - School enrollment
- Results incorporated into final Regional Water Plan

Socioeconomic Impacts Analysis – 2011 Region H Water Plan

Lost Income by Sector (Millions)

Socioeconomic Impact Analysis – 2011 Region H Water Plan

Socioeconomic impact of not meeting water supply needs vs. impact of proposed desired future conditions

- Regional Water Planning (from TWDB)
 - Generate Input-Output Models combined with Social Accounting Models (IO/SAM) and develop economic baselines. Utilizes IMPLAN (Impact for Planning Analysis) software.
 - Economic baseline developed for counties, planning regions, and the state based on variables for 528 economic sectors as follows:

Socioeconomic impact of not meeting water supply needs vs. impact of proposed desired future conditions

- output total production of goods and services measured by gross sales revenues
- final sales sales to end user in Texas (a region) and exports out of region
- Employment number of full and part-time jobs required by a given industry
- Regional income total payroll costs paid by industries, corporate income, rental income, and interest payments
- Business taxes sales, excise, fees, licenses and other taxes paid during normal operation

Socioeconomic impact of not meeting water supply needs vs. impact of proposed desired future conditions

- Regional Water Planning (from TWDB cont.)
 - Estimate direct and indirect impacts to business, industry, and agriculture
 - Impact associated with domestic water usage
- While useful for planning purposes, socioeconomic impacts developed for regional water planning do not represent a benefit-cost analysis.
- Analysis only executed for water user groups with needs for additional water supply.

Impacts by County for the Brazos G Regional Water Planning Area (\$ millions)

Impacts by county are not presented in the 2011 East Texas Regional Water Plan. For full analysis, see TWDB correspondence to Kelley Holcomb from Stuart Norvell dated June 1, 2010, titled "Socioeconomic impact analysis of not meeting water needs for the 2011 East Texas Regional Water Plan."

Potential socioeconomic impact of proposed DFCs

During the first round of joint-planning (2005 – 2010), the TWDB adopted rules to describe what is to be considered in the petition process. With the passage of Senate Bill 660, these <u>rules were repealed</u>.

TAC § 356.45. Board Evaluation, Consideration, and Deliberation

(a) The executive administrator shall prepare a list of findings based on evidence received at the hearing and may also provide a summary, analysis, and recommendations relating to revisions to districts' plans and desired future conditions to the board.

Potential socioeconomic impact of proposed DFCs (cont. – note, these rules repealed with passage of SB 660 in 2011)

TAC § 356.45. Board Evaluation, Consideration, and Deliberation (cont.)

- (b) The executive administrator or the board may, at any stage of the process described in this subchapter, terminate the proceedings on a petition when an agreement is reached resolving the petition or a petition has been withdrawn. Any such agreements shall become a part of the record.
- (c) The board shall base any recommended revisions to a plan and to the desired future conditions only on evidence in the hearing record. The board shall consider the following criteria when determining whether a desired future condition is reasonable:

Potential socioeconomic impact of proposed DFCs (cont. – note, these rules repealed with passage of SB 660 in 2011)

(1) the adopted desired future conditions are physically possible and the consideration given groundwater use;

(2) the socio-economic impacts reasonably expected to occur;

- (3) the environmental impacts including, but not limited to, impacts to spring flow or other interaction between groundwater and surface water;
- (4) the state's policy and legislative directives;
- (5) the impact on private property rights;
- (6) the reasonable and prudent development of the state's groundwater resources; and
- (7) any other information relevant to the specific desired future condition.

Petitions from the first round and socioeconomic impacts considered

- GMA 1
 - TWDB report dated February 10, 2010
- GMA 12
 - TWDB report dated June 13, 2012

Potential socioeconomic impact of proposed DFCs

- TWC Chapter 36.108 (d) and (d) (6) states, "the districts shall consider groundwater availability models and other data or information for the management area and shall propose for adoption desired future conditions for the relevant aquifers within the management area. Before voting on the proposed desired future conditions of the aquifers . . . the districts shall consider socioeconomic impacts reasonably expected to occur;"
- Proposed DFCs are quantitative descriptions at specific points in time (decadal) of groundwater resources in a management area.
- This requirement was added to the requirements of joint planning with the passage of Senate Bill 660 in 2011.

Potential socioeconomic impact of proposed DFCs

- From a qualitative perspective, both positive and negative socioeconomic impacts may potentially result from implementation of proposed DFCs.
 - Proposed DFCs may require conversion to alternative supply, which may have increased costs associated to infrastructure, operation, and maintenance.
 - Proposed DFCs may reduce/eliminate the costs of lowering pumps and either drilling or deepening of wells.
 - Proposed DFCs may reduce/eliminate the costs associated with subsidence (including legal costs assigned to parties determined to be liable).

Potential socioeconomic impact of proposed DFCs

- Positive and negative socioeconomic impacts potentially resulting from implementation of proposed DFCs:
 - Proposed DFCs may serve to sustain/enhance economic growth due to assurances provided by diversified water portfolio.
 - Alternatives to proposed DFCs may result in short-term reduction in utility rates due to reduction in cost of water management strategy implementation.
 - Alternatives to proposed DFCs may result in significant but unquantified production costs due to transition from confined to unconfined conditions in local aquifers.

Re:

Socioeconomic Impact Analysis of Not Meeting Water Needs for the 2011 Brazos G

Regional Water Plan

Dear Chairman Spurgin:

We have received your request for technical assistance to complete the socioeconomic impact analysis of not meeting water needs. In response, enclosed is a report that describes our methodology and presents the results. Section 1 provides an overview of the methodology, and Section 2 presents results at the regional level, and Appendix 2 show results for individual water user groups.

If you have any questions or comments, please feel free to contact me at (512) 463-7928 or by email at stuart.norvell@twdb.state.tx.us.

Sincerely.

Stuart D. Norvell

Manager, Water Planning Research and Analysis

Introduction

Water shortages during drought would likely curtail or eliminate economic activity in business and industries reliant on water. For example, without water farmers cannot irrigate; refineries cannot produce gasoline, and paper mills cannot make paper. Unreliable water supplies would not only have an immediate and real impact on existing businesses and industry, but they could also adversely affect economic development in Texas. From a social perspective, water supply reliability is critical as well. Shortages would disrupt activity in homes, schools and government and could adversely affect public health and safety. For all of the above reasons, it is important to analyze and understand how restricted water supplies during drought could affect communities throughout the state.

Administrative rules require that regional water planning groups evaluate the impacts of not meeting water needs as part of the regional water planning process, and rules direct TWDB staff to provide technical assistance: "The executive administrator shall provide available technical assistance to the regional water planning groups, upon request, on water supply and demand analysis, including methods to evaluate the social and economic impacts of not meeting needs" [(§357.7 (4)(A)]. Staff of the TWDB's Water Resources Planning Division designed and conducted this report in support of the Brazos G Regional Water Planning Group (Region G).

This document summarizes the results of our analysis and discusses the methodology used to generate the results. Section 1 outlines the overall methodology and discusses approaches and assumptions specific to each water use category (i.e., irrigation, livestock, mining, steam-electric, municipal and manufacturing). Section 2 presents the results for each category where shortages are reported at the regional planning area level and river basin level. Results for individual water user groups are not presented, but are available upon request.

1. Methodology

Section 1 provides a general overview of how economic and social impacts were measured. In addition, it summarizes important clarifications, assumptions and limitations of the study.

1.1 Economic Impacts of Water Shortages

1.1.1 General Approach

Economic analysis as it relates to water resources planning generally falls into two broad areas. Supply side analysis focuses on costs and alternatives of developing new water supplies or implementing programs that provide additional water from current supplies. Demand side analysis concentrates on impacts or benefits of providing water to people, businesses and the environment. Analysis in this report focuses strictly on demand side impacts. When analyzing the economic impacts of water shortages as defined in Texas water planning, three potential scenarios are possible:

Scenario 1 involves situations where there are physical shortages of raw surface or groundwater due to drought of record conditions. For example, City A relies on a reservoir with average conservation storage of 500 acre-feet per year and a firm yield of 100 acre feet. In 2010, the city uses about 50 acre-feet per year, but by 2030 their demands are expected to increase to 200 acre-feet. Thus, in 2030 the reservoir would not have enough water to meet the city's demands, and people would experience a shortage of 100 acre-feet assuming drought of record conditions. Under normal or average climatic conditions, the reservoir would likely be able to provide reliable water supplies well beyond 2030.

- 2) Scenario 2 is a situation where despite drought of record conditions, water supply sources can meet existing use requirements; however, limitations in water infrastructure would preclude future water user groups from accessing these water supplies. For example, City B relies on a river that can provide 500 acre-feet per year during drought of record conditions and other constraints as dictated by planning assumptions. In 2010, the city is expected to use an estimated 100 acre-feet per year and by 2060 it would require no more than 400 acre-feet. But the intake and pipeline that currently transfers water from the river to the city's treatment plant has a capacity of only 200 acre-feet of water per year. Thus, the city's water supplies are adequate even under the most restrictive planning assumptions, but their conveyance system is too small. This implies that at some point perhaps around 2030 infrastructure limitations would constrain future population growth and any associated economic activity or impacts.
- 3) Scenario 3 involves water user groups that rely primarily on aquifers that are being depleted. In this scenario, projected and in some cases existing demands may be unsustainable as groundwater levels decline. Areas that rely on the Ogallala aquifer are a good example. In some communities in the region, irrigated agriculture forms a major base of the regional economy. With less irrigation water from the Ogallala, population and economic activity in the region could decline significantly assuming there are no offsetting developments.

Assessing the social and economic effects of each of the above scenarios requires various levels and methods of analysis and would generate substantially different results for a number of reasons; the most important of which has to do with the time frame of each scenario. Scenario 1 falls into the general category of static analysis. This means that models would measure impacts for a small interval of time such as a drought. Scenarios 2 and 3, on the other hand imply a dynamic analysis meaning that models are concerned with changes over a much longer time period.

Since administrative rules specify that planning analysis be evaluated under drought of record conditions (a static and random event), socioeconomic impact analysis developed by the TWDB for the state water plan is based on assumptions of Scenario 1. Estimated impacts under scenario 1 are point estimates for years in which needs are reported (2010, 2020, 2030, 2040, 2050 and 2060). They are independent and distinct "what if" scenarios for a particular year and shortages are assumed to be temporary events resulting from drought of record conditions. Estimated impacts measure what would happen if water user groups experience water shortages for a period of one year.

The TWDB recognize that dynamic models may be more appropriate for some water user groups; however, combining approaches on a statewide basis poses several problems. For one, it would require a complex array of analyses and models, and might require developing supply and demand forecasts under "normal" climatic conditions as opposed to drought of record conditions. Equally important is the notion that combining the approaches would produce inconsistent results across regions resulting in a so-called "apples to oranges" comparison.

A variety tools are available to estimate economic impacts, but by far, the most widely used today are input-output models (IO models) combined with social accounting matrices (SAMs). Referred to as IO/SAM models, these tools formed the basis for estimating economic impacts for agriculture (irrigation and livestock water uses) and industry (manufacturing, mining, steam-electric and commercial business activity for municipal water uses).

Since the planning horizon extends through 2060, economic variables in the baseline are adjusted in accordance with projected changes in demographic and economic activity. Growth rates for municipal water use sectors (i.e., commercial, residential and institutional) are based on TWDB population forecasts. Future values for manufacturing, agriculture, and mining and steam-electric activity are based on the same underlying economic forecasts used to estimate future water use for each category.

The following steps outline the overall process.

Step 1: Generate IO/SAM Models and Develop Economic Baseline

IO/SAM models were estimated using propriety software known as IMPLAN PROTM (Impact for Planning Analysis). IMPLAN is a modeling system originally developed by the U.S. Forestry Service in the late 1970s. Today, the Minnesota IMPLAN Group (MIG Inc.) owns the copyright and distributes data and software. It is probably the most widely used economic impact model in existence. IMPLAN comes with databases containing the most recently available economic data from a variety of sources. Using IMPLAN software and data, transaction tables conceptually similar to the one discussed previously were estimated for each county in the region and for the region as a whole. Each transaction table contains 528 economic sectors and allows one to estimate a variety of economic statistics including:

- total sales total production measured by sales revenues;
- intermediate sales sales to other businesses and industries within a given region;
- final sales sales to end users in a region and exports out of a region;
- employment number of full and part-time jobs (annual average) required by a given industry including self-employment;
- regional income total payroll costs (wages and salaries plus benefits) paid by industries, corporate income, rental income and interest payments; and
- **business taxes** sales, excise, fees, licenses and other taxes paid during normal operation of an industry (does not include income taxes).

TWDB analysts developed an economic baseline containing each of the above variables using year 2000 data. Since the planning horizon extends through 2060, economic variables in the baseline were allowed to change in accordance with projected changes in demographic and economic activity. Growth rates for municipal water use sectors (i.e., commercial, residential and institutional) are based on TWDB population forecasts. Projections for manufacturing, agriculture, and mining and steam-electric activity are based on the same underlying economic forecasts used to estimate future water use for each category. Monetary impacts in future years are reported in constant year 2006 dollars.

It is important to stress that employment, income and business taxes are the most useful variables when comparing the relative contribution of an economic sector to a regional economy. Total sales as reported in IO/SAM models are less desirable and can be misleading because they include sales to other industries in the region for use in the production of other goods. For example, if a mill buys grain from local farmers and uses it to produce feed, sales of both the processed feed and raw corn are counted

¹The IMPLAN database consists of national level technology matrices based on benchmark input-output accounts generated by the U.S. Bureau of Economic Analysis and estimates of final demand, final payments, industry output and employment for various economic sectors. IMPLAN regional data (i.e. states, a counties or groups of counties within a state) are divided into two basic categories: 1) data on an industry basis including value-added, output and employment, and 2) data on a commodity basis including final demands and institutional sales. State-level data are balanced to national totals using a matrix ratio allocation system and county data are balanced to state totals.

as "output" in an IO model. Thus, total sales double-count or overstate the true economic value of goods and services produced in an economy. They are not consistent with commonly used measures of output such as Gross National Product (GNP), which counts only final sales.

Another important distinction relates to terminology. Throughout this report, the term sector refers to economic subdivisions used in the IMPLAN database and resultant input-output models (528 individual sectors based on Standard Industrial Classification Codes). In contrast, the phrase water use category refers to water user groups employed in state and regional water planning including irrigation, livestock, mining, municipal, manufacturing and steam electric. Each IMPLAN sector was assigned to a specific water use category.

Step 2: Estimate Direct and Indirect Economic Impacts of Water Needs

Direct impacts are reductions in output by sectors experiencing water shortages. For example, without adequate cooling and process water a refinery would have to curtail or cease operation, car washes may close, or farmers may not be able to irrigate and sales revenues fall. Indirect impacts involve changes in inter-industry transactions as supplying industries respond to decreased demands for their services, and how seemingly non-related businesses are affected by decreased incomes and spending due to direct impacts. For example, if a farmer ceases operations due to a lack of irrigation water, they would likely reduce expenditures on supplies such as fertilizer, labor and equipment, and businesses that provide these goods would suffer as well.

Direct impacts accrue to immediate businesses and industries that rely on water and without water industrial processes could suffer. However, output responses may vary depending upon the severity of shortages. A small shortage relative to total water use would likely have a minimal impact, but large shortages could be critical. For example, farmers facing small shortages might fallow marginally productive acreage to save water for more valuable crops. Livestock producers might employ emergency culling strategies, or they may consider hauling water by truck to fill stock tanks. In the case of manufacturing, a good example occurred in the summer of 1999 when Toyota Motor Manufacturing experienced water shortages at a facility near Georgetown, Kentucky. As water levels in the Kentucky River fell to historic lows due to drought, plant managers sought ways to curtail water use such as reducing rinse operations to a bare minimum and recycling water by funneling it from paint shops to boilers. They even considered trucking in water at a cost of 10 times what they were paying. Fortunately, rains at the end of the summer restored river levels, and Toyota managed to implement cutbacks without affecting production, but it was a close call. If rains had not replenished the river, shortages could have severely reduced output.

To account for uncertainty regarding the relative magnitude of impacts to farm and business operations, the following analysis employs the concept of elasticity. Elasticity is a number that shows how a change in one variable will affect another. In this case, it measures the relationship between a percentage reduction in water availability and a percentage reduction in output. For example, an elasticity of 1.0 indicates that a 1.0 percent reduction in water availability would result in a 1.0 percent reduction in

³ The efforts described above are not planned programmatic or long-term operational changes. They are emergency measures that individuals might pursue to alleviate what they consider a temporary condition. Thus, they are not characteristic of long-term management strategies designed to ensure more dependable water supplies such as capital investments in conservation technology or development of new water supplies.

² Royal, W. "High And Dry - Industrial Centers Face Water Shortages." in Industry Week, Sept, 2000.

economic output. An elasticity of 0.50 would indicate that for every 1.0 percent of unavailable water, output is reduced by 0.50 percent and so on. Output elasticities used in this study are:⁴

- if water needs are 0 to 5 percent of total water demand, no corresponding reduction in output is assumed;
- if water needs are 5 to 30 percent of total water demand, for each additional one percent of water need that is not met, there is a corresponding 0.50 percent reduction in output;
- if water needs are 30 to 50 percent of total water demand, for each additional one percent of water need that is not met, there is a corresponding 0.75 percent reduction in output; and
- if water needs are greater than 50 percent of total water demand, for each additional one percent of water need that is not met, there is a corresponding 1.0 percent (i.e., a proportional reduction).

In some cases, elasticities are adjusted depending upon conditions specific to a given water user group.

Once output responses to water shortages were estimated, direct impacts to total sales, employment, regional income and business taxes were derived using regional level economic multipliers estimating using IO/SAM models. The formula for a given IMPLAN sector is:

$$D_{i,t} = Q_{i,t} *_{,} S_{i,t} *_{,} E_{Q} *_{,} RFD_{i} *_{,} DM_{i(Q,L,I,T)}$$

where:

 $D_{i,t}$ = direct economic impact to sector i in period t

 $Q_{i,t}$ = total sales for sector *i* in period *t* in an affected county

RFD_{i.} = ratio of final demand to total sales for sector *i* for a given region

 $S_{i,t}$ = water shortage as percentage of total water use in period t

 E_0 = elasticity of output and water use

 $DM_{i(L, I, T)}$ = direct output multiplier coefficients for labor (L), income (I) and taxes (T) for sector i.

Secondary impacts were derived using the same formula used to estimate direct impacts; however, indirect multiplier coefficients are used. Methods and assumptions specific to each water use sector are discussed in Sections 1.1.2 through 1.1.4.

⁴ Elasticities are based on one of the few empirical studies that analyze potential relationships between economic output and water shortages in the United States. The study, conducted in California, showed that a significant number of industries would suffer reduced output during water shortages. Using a survey based approach researchers posed two scenarios to different industries. In the first scenario, they asked how a 15 percent cutback in water supply lasting one year would affect operations. In the second scenario, they asked how a 30 percent reduction lasting one year would affect plant operations. In the case of a 15 percent shortage, reported output elasticities ranged from 0.00 to 0.76 with an average value of 0.25. For a 30 percent shortage, elasticities ranged from 0.00 to 1.39 with average of 0.47. For further information, see, California Urban Water Agencies, "Cost of Industrial Water Shortages," Spectrum Economics, Inc. November, 1991.

General Assumptions and Clarification of the Methodology

As with any attempt to measure and quantify human activities at a societal level, assumptions are necessary and every model has limitations. Assumptions are needed to maintain a level of generality and simplicity such that models can be applied on several geographic levels and across different economic sectors. In terms of the general approach used here several clarifications and cautions are warranted:

- 1. Shortages as reported by regional planning groups are the starting point for socioeconomic analyses.
- 2. Estimated impacts are point estimates for years in which needs are reported (i.e., 2010, 2020, 2030, 2040, 2050 and 2060). They are independent and distinct "what if" scenarios for each particular year and water shortages are assumed to be temporary events resulting from severe drought conditions combined with infrastructure limitations. In other words, growth occurs and future shocks are imposed on an economy at 10-year intervals and resultant impacts are measured. Given, that reported figures are not cumulative in nature, it is inappropriate to sum impacts over the entire planning horizon. Doing so, would imply that the analysis predicts that drought of record conditions will occur every ten years in the future, which is not the case. Similarly, authors of this report recognize that in many communities needs are driven by population growth, and in the future total population will exceed the amount of water available due to infrastructure limitations, regardless of whether or not there is a drought. This implies that infrastructure limitations would constrain economic growth. However, since needs as defined by planning rules are based upon water supply and demand under the assumption of drought of record conditions, it improper to conduct economic analysis that focuses on growth related impacts over the planning horizon. Figures generated from such an analysis would presume a 50-year drought of record, which is unrealistic. Estimating lost economic activity related to constraints on population and commercial growth due to lack of water would require developing water supply and demand forecasts under "normal" or "most likely" future climatic conditions.
- 3. While useful for planning purposes, this study is not a benefit-cost analysis. Benefit cost analysis is a tool widely used to evaluate the economic feasibility of specific policies or projects as opposed to estimating economic impacts of unmet water needs. Nevertheless, one could include some impacts measured in this study as part of a benefit cost study if done so properly. Since this is not a benefit cost analysis, future impacts are not weighted differently. In other words, estimates are not discounted. If used as a measure of economic benefits, one should incorporate a measure of uncertainty into the analysis. In this type of analysis, a typical method of discounting future values is to assign probabilities of the drought of record recurring again in a given year, and weight monetary impacts accordingly. This analysis assumes a probability of one.
- 4. IO multipliers measure the strength of backward linkages to supporting industries (i.e., those who sell inputs to an affected sector). However, multipliers say nothing about forward linkages consisting of businesses that purchase goods from an affected sector for further processing. For example, ranchers in many areas sell most of their animals to local meat packers who process animals into a form that consumers ultimately see in grocery stores and restaurants. Multipliers do not capture forward linkages to meat packers, and since meat packers sell livestock purchased from ranchers as "final sales," multipliers for the ranching sector do fully account for all losses to a region's economy. Thus, as mentioned previously, in some cases closely linked sectors were moved from one water use category to another.
- 5. Cautions regarding interpretations of direct and secondary impacts are warranted. IO/SAM multipliers are based on "fixed-proportion production functions," which basically means that input use including labor moves in lockstep fashion with changes in levels of output. In a

scenario where output (i.e., sales) declines, losses in the immediate sector or supporting sectors could be much less than predicted by an IO/SAM model for several reasons. For one, businesses will likely expect to continue operating so they might maintain spending on inputs for future use; or they may be under contractual obligations to purchase inputs for an extended period regardless of external conditions. Also, employers may not lay-off workers given that experienced labor is sometimes scarce and skilled personnel may not be readily available when water shortages subside. Lastly people who lose jobs might find other employment in the region. As a result, direct losses for employment and secondary losses in sales and employment should be considered an upper bound. Similarly, since projected population losses are based on reduced employment in the region, they should be considered an upper bound as well.

- 6. IO models are static. Models and resultant multipliers are based upon the structure of the U.S. and regional economies in 2006. In contrast, water shortages are projected to occur well into the future. Thus, the analysis assumes that the general structure of the economy remains the same over the planning horizon, and the farther out into the future we go, this assumption becomes less reliable.
- 7. Impacts are annual estimates. If one were to assume that conditions persisted for more than one year, figures should be adjusted to reflect the extended duration. The drought of record in most regions of Texas lasted several years.
- 8. Monetary figures are reported in constant year 2006 dollars.

1.1.2 Impacts to Agriculture

Irrigated Crop Production

The first step in estimating impacts to irrigation required calculating gross sales for IMPLAN crop sectors. Default IMPLAN data do not distinguish irrigated production from dry-land production. Once gross sales were known other statistics such as employment and income were derived using IMPLAN direct multiplier coefficients. Gross sales for a given crop are based on two data sources:

- 1) county-level statistics collected and maintained by the TWDB and the USDA Farm Services Agency (FSA) including the number of irrigated acres by crop type and water application per acre, and
- 2) regional-level data published by the Texas Agricultural Statistics Service (TASS) including prices received for crops (marketing year averages), crop yields and crop acreages.

Crop categories used by the TWDB differ from those used in IMPLAN datasets. To maintain consistency, sales and other statistics are reported using IMPLAN crop classifications. Table 1 shows the TWDB crops included in corresponding IMPLAN sectors, and Table 2 summarizes acreage and estimated annual water use for each crop classification (five-year average from 2003-2007). Table 3 displays average (2003-2007) gross revenues per acre for IMPLAN crop categories.

Table 1: Crop Classifications Used in TWDB Water Use Survey and Corresponding IMPLAN Crop Sectors			
IMPLAN Category	TWDB Category		
Oilseeds	Soybeans and "other oil crops"		
Grains	Grain sorghum, corn, wheat and "other grain crops"		
Vegetable and melons	"Vegetables" and potatoes		
Tree nuts	Pecans		
Fruits	Citrus, vineyard and other orchard		
Cotton	Cotton		
Sugarcane and sugar beets	Sugarcane and sugar beets		
All "other" crops	"Forage crops", peanuts, alfalfa, hay and pasture, rice and "all other crops"		

Table 2: Summary of Irrigated Crop Acreage and Water Demand for the Brazos G Regional Water Planning Area (average 2003-2007)				
Sector	Acres (1000s)	Distribution of acres	Water use (1000s of AF)	Distribution of water use
Oilseeds	3.4	2%	3.4	1%
Grains	62.4	30%	58.6	27%
Vegetable and melons	5.7	3%	5.1	2%
Tree nuts	13.2	6%	18.7	9%
Fruits	<1	<1%	<1	<1%
Cotton	71.7	35%	78.4	36%
Sugarcane and sugar beets	50.6	24%	54.7	25%
Total	206.9	100%	219.0	100%

Source: Water demand figures are a 5- year average (2003-2007) of the TWDB's annual Irrigation Water Use Estimates. Statistics for irrigated crop acreage are based upon annual survey data collected by the TWDB and the Farm Service Agency. Values do not include acreage or water use for the TWDB categories classified by the Farm Services Agency as "failed acres," "golf course" or "waste water."

MPLAN Sector	Gross revenues per acre	Crops included in estimates
Dilseeds	\$268	Based on five-year (2003-2007) average weighted by acreage for "irrigated soybeans" and "irrigated other oil crops."
Grains	\$256	Based on five-year (2003-2007) average weighted by acreage for "irrigated grain sorghum," "irrigated corn", "irrigated wheat" and "irrigated 'other' grain crops."
egetable and melons	\$6,151	Based on five-year (2003-2007) average weighted by acreage for "irrigated shallow and deep root vegetables", "irrigated Irish potatoes" and "irrigated melons."
Tree nuts	\$3,420	Based on five-year (2003-2007) average weighted by acreage for "irrigated pecans."
Fruits	\$2,175	Based on five-year (2003-2007) average weighted by acreage for "irrigated citrus", "irrigated vineyards" and "irrigated 'other' orchard."
Cotton	\$499	Based on five-year (2003-2007) average weighted by acreage for "irrigated cotton."
All Other Crops	\$582	Irrigated figure is based on five-year (2003-2007) average weighted by acreage for "irrigated 'forage' crops", "irrigated peanuts", "irrigated alfalfa", "irrigated 'hay' and pasture" and "irrigated 'all other' crops."

An important consideration when estimating impacts to irrigation was determining which crops are affected by water shortages. One approach is the so-called rationing model, which assumes that farmers respond to water supply cutbacks by fallowing the lowest value crops in the region first and the highest valued crops last until the amount of water saved equals the shortage. For example, if farmer A grows vegetables (higher value) and farmer B grows wheat (lower value) and they both face a proportionate cutback in irrigation water, then farmer B will sell water to farmer A. Farmer B will fallow her irrigated acreage before farmer A fallows anything. Of course, this assumes that farmers can and do transfer enough water to allow this to happen. A different approach involves constructing farm-level profit maximization models that conform to widely-accepted economic theory that farmers make decisions based on marginal net returns. Such models have good predictive capability, but data requirements and complexity are high. Given that a detailed analysis for each region would require a substantial amount of farm-level data and analysis, the following investigation assumes that projected shortages are distributed equally across predominant crops in the region. Predominant in this case are crops that comprise at least one percent of total acreage in the region.

The following steps outline the overall process used to estimate direct impacts to irrigated agriculture:

- Distribute shortages across predominant crop types in the region. Again, unmet water needs
 were distributed equally across crop sectors that constitute one percent or more of irrigated
 acreage.
- 2. Estimate associated reductions in output for affected crop sectors. Output reductions are based on elasticities discussed previously and on estimated values per acre for different crops. Values per acre stem from the same data used to estimate output for the year 2006 baseline. Using multipliers, we then generate estimates of forgone income, jobs, and tax revenues based on reductions in gross sales and final demand.

Livestock

The approach used for the livestock sector is basically the same as that used for crop production. As is the case with crops, livestock categorizations used by the TWDB differ from those used in IMPLAN datasets, and TWDB groupings were assigned to a given IMPLAN sector (Table 4). Then we:

1) Distribute projected water needs equally among predominant livestock sectors and estimate lost output: As is the case with irrigation, shortages are assumed to affect all livestock sectors equally; however, the category of "other" is not included given its small size. If water needs were small relative to total demands, we assume that producers would haul in water by truck to fill stock tanks. The cost per acre-foot (\$24,000) is based on 2008 rates charged by various water haulers in Texas, and assumes that the average truck load is 6,500 gallons at a hauling distance of 60 miles.

3) Estimate reduced output in forward processors for livestock sectors. Reductions in output for livestock sectors are assumed to have a proportional impact on forward processors in the region such as meat packers. In other words, if the cows were gone, meat-packing plants or fluid milk

5

⁵ The rationing model was initially proposed by researchers at the University of California at Berkeley, and was then modified for use in a study conducted by the U.S. Environmental Protection Agency that evaluated how proposed water supply cutbacks recommended to protect water quality in the Bay/Delta complex in California would affect farmers in the Central Valley. See, Zilberman, D., Howitt, R. and Sunding, D. "Economic Impacts of Water Quality Regulations in the San Francisco Bay and Delta." Western Consortium for Public Health. May 1993.

manufacturers) would likely have little to process. This is not an unreasonable premise. Since the 1950s, there has been a major trend towards specialized cattle feedlots, which in turn has decentralized cattle purchasing from livestock terminal markets to direct sales between producers and slaughterhouses. Today, the meat packing industry often operates large processing facilities near high concentrations of feedlots to increase capacity utilization. As a result, packers are heavily dependent upon nearby feedlots. For example, a recent study by the USDA shows that on average meat packers obtain 64 percent of cattle from within 75 miles of their plant, 82 percent from within 150 miles and 92 percent from within 250 miles.

Table 4: Description of Livestock Sectors			
IMPLAN Category	TWDB Category		
Cattle ranching and farming	Cattle, cow calf, feedlots and dairies		
Poultry and egg production	Poultry production.		
Other livestock	Livestock other than cattle and poultry (i.e., horses, goats, sheep, hogs)		
Milk manufacturing	Fluid milk manufacturing, cheese manufacturing, ice cream manufacturing etc.		
Meat packing	Meat processing present in the region from slaughter to final processing		

1.1.3 Impacts to Municipal Water User Groups

Disaggregation of Municipal Water Demands

Estimating the economic impacts for the municipal water user groups is complicated for a number of reasons. For one, municipal use comprises a range of consumers including commercial businesses, institutions such as schools and government and households. However, reported water needs are not distributed among different municipal water users. In other words, how much of a municipal need is commercial and how much is residential (domestic)?

The amount of commercial water use as a percentage of total municipal demand was estimated based on "GED" coefficients (gallons per employee per day) published in secondary sources. For example, if year 2006 baseline data for a given economic sector (e.g., amusement and recreation services) shows

⁶ Ferreira, W.N. "Analysis of the Meat Processing Industry in the United States." Clemson University Extension Economics Report ER211, January 2003.

⁷ Ward, C.E. "Summary of Results from USDA's Meatpacking Concentration Study." Oklahoma Cooperative Extension Service, OSU Extension Facts WF-562.

⁸ Sources for GED coefficients include: Gleick, P.H., Haasz, D., Henges-Jeck, C., Srinivasan, V., Wolff, G. Cushing, K.K., and Mann, A. "Waste Not, Want Not: The Potential for Urban Water Conservation in California." Pacific Institute. November 2003. U.S. Bureau of the Census. 1982 Census of Manufacturers: Water Use in Manufacturing. USGPO, Washington D.C. See also: "U.S. Army Engineer Institute for Water Resources, IWR Report 88-R-6.," Fort Belvoir, VA. See also, Joseph, E. S., 1982, "Municipal and Industrial Water Demands of the Western United States." Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, v. 108, no. WR2, p. 204-216. See also, Baumann, D. D., Boland, J. J., and Sims, J. H., 1981, "Evaluation of Water Conservation for Municipal and Industrial Water Supply." U.S. Army Corps of Engineers, Institute for Water Resources, Contract no. 82-C1.

employment at 30 jobs and the GED coefficient is 200, then average daily water use by that sector is $(30 \times 200 = 6,000 \text{ gallons})$ or 6.7 acre-feet per year. Water not attributed to commercial use is considered domestic, which includes single and multi-family residential consumption, institutional uses and all use designated as "county-other." Based on our analysis, commercial water use is about 5 to 35 percent of municipal demand. Less populated rural counties occupy the lower end of the spectrum, while larger metropolitan counties are at the higher end.

After determining the distribution of domestic versus commercial water use, we developed methods for estimating impacts to the two groups.

Domestic Water Uses

Input output models are not well suited for measuring impacts of shortages for domestic water uses, which make up the majority of the municipal water use category. To estimate impacts associated with domestic water uses, municipal water demand and needs are subdivided into residential, and commercial and institutional use. Shortages associated with residential water uses are valued by estimating proxy demand functions for different water user groups allowing us to estimate the marginal value of water, which would vary depending upon the level of water shortages. The more severe the water shortage, the more costly it becomes. For instance, a 2 acre-foot shortage for a group of households that use 10 acre-feet per year would not be as severe as a shortage that amounted to 8 acre-feet. In the case of a 2 acre-foot shortage, households would probably have to eliminate some or all outdoor water use, which could have implicit and explicit economic costs including losses to the horticultural and landscaping industry. In the case of an 8 acre-foot shortage, people would have to forgo all outdoor water use and most indoor water consumption. Economic impacts would be much higher in the latter case because people, and would be forced to find emergency alternatives assuming alternatives were available.

To estimate the value of domestic water uses, TWDB staff developed marginal loss functions based on constant elasticity demand curves. This is a standard and well-established method used by economists to value resources such as water that have an explicit monetary cost.

A constant price elasticity of demand is estimated using a standard equation:

$$w = kc^{(-\varepsilon)}$$

where:

- w is equal to average monthly residential water use for a given water user group measured in thousands of gallons;
- k is a constant intercept;
- c is the average cost of water per 1,000 gallons; and
- ϵ is the price elasticity of demand.

Price elasticities (-0.30 for indoor water use and -0.50 for outdoor use) are based on a study by Bell et al. 9 that surveyed 1,400 water utilities in Texas that serve at least 1,000 people to estimate demand elasticity for several variables including price, income, weather etc. Costs of water and average

⁹ Bell, D.R. and Griffin, R.C. "Community Water Demand in Texas as a Century is Turned." Research contract report prepared for the Texas Water Development Board. May 2006.

use per month per household are based on data from the Texas Municipal League's annual water and wastewater rate surveys - specifically average monthly household expenditures on water and wastewater in different communities across the state. After examining variance in costs and usage, three different categories of water user groups based on population (population less than 5,000, cities with populations ranging from 5,000 to 99,999 and cities with populations exceeding 100,000) were selected to serve as proxy values for municipal water groups that meet the criteria (Table 5).¹⁰

Table 5: Water Use and Costs Parameters Used to Estimated Water Demand Functions (average monthly costs per acre-foot for delivered water and average monthly use per household)				
Community Population	Water	Wastewater	Total monthly cost	Avg. monthly use (gallons)
Less than or equal to 5,000	\$1,335	\$1,228	\$2,563	6,204
5,000 to 100,000	\$1,047	\$1,162	\$2,209	7,950
Great than or equal to 100,000	\$718	\$457	\$1,190	8,409

As an example, Table 6 shows the economic impact per acre-foot of domestic water needs for municipal water user groups with population exceeding 100,000 people. There are several important assumptions incorporated in the calculations:

- 1) Reported values are net of the variable costs of treatment and distribution such as expenses for chemicals and electricity since using less water involves some savings to consumers and utilities alike; and for outdoor uses we do not include any value for wastewater.
- 2) Outdoor and "non-essential" water uses would be eliminated before indoor water consumption was affected, which is logical because most water utilities in Texas have drought contingency plans that generally specify curtailment or elimination of outdoor water use during droughts. ¹¹ Determining how much water is used for outdoor purposes is based on several secondary sources. The first is a major study sponsored by the American Water Works Association, which surveyed cities in states including Colorado, Oregon, Washington, California, Florida and Arizona. On average across all cities surveyed 58 percent of single family residential water use was for outdoor activities. In cities with climates comparable to large metropolitan areas of Texas, the average was

¹¹ In Texas, state law requires retail and wholesale water providers to prepare and submit plans to the Texas Commission on Environmental Quality (TCEQ). Plans must specify demand management measures for use during drought including curtailment of "non-essential water uses." Non-essential uses include, but are not limited to, landscape irrigation and water for swimming pools or fountains. For further information see the Texas Environmental Quality Code §288.20.

15

¹⁰ Ideally, one would want to estimate demand functions for each individual utility in the state. However, this would require an enormous amount of time and resources. For planning purposes, we believe the values generated from aggregate data are more than sufficient.

40 percent.¹² Earlier findings of the U.S. Water Resources Council showed a national average of 33 percent. Similarly, the United States Environmental Protection Agency (USEPA) estimated that landscape watering accounts for 32 percent of total residential and commercial water use on annual basis.¹³ A study conducted for the California Urban Water Agencies (CUWA) calculated average annual values ranging from 25 to 35 percent.¹⁴ Unfortunately, there does not appear to be any comprehensive research that has estimated non-agricultural outdoor water use in Texas. As an approximation, an average annual value of 30 percent based on the above references was selected to serve as a rough estimate in this study.

3) As shortages approach 100 percent values become immense and theoretically infinite at 100 percent because at that point death would result, and willingness to pay for water is immeasurable. Thus, as shortages approach 80 percent of monthly consumption, we assume that households and non-water intensive commercial businesses (those that use water only for drinking and sanitation would have water delivered by tanker truck or commercial water delivery companies. Based on reports from water companies throughout the state, we estimate that the cost of trucking in water is around \$21,000 to \$27,000 per acre-feet assuming a hauling distance of between 20 to 60 miles. This is not an unreasonable assumption. The practice was widespread during the 1950s drought and recently during droughts in this decade. For example, in 2000 at the heels of three consecutive drought years Electra - a small town in North Texas - was down to its last 45 days worth of reservoir water when rain replenished the lake, and the city was able to refurbish old wells to provide supplemental groundwater. At the time, residents were forced to limit water use to 1,000 gallons per person per month - less than half of what most people use - and many were having water delivered to their homes by private contractors. 15 In 2003 citizens of Ballinger, Texas, were also faced with a dwindling water supply due to prolonged drought. After three years of drought, Lake Ballinger, which supplies water to more than 4,300 residents in Ballinger and to 600 residents in nearby Rowena, was almost dry. Each day, people lined up to get water from a well in nearby City Park. Trucks hauling trailers outfitted with large plastic and metal tanks hauled water to and from City Park to Ballinger. 16

Infinite (\$0.07)

^a The first 30 percent of needs are assumed to be restrictions of outdoor water use; when needs reach 30 percent of total demands all outdoor water uses would be restricted. Needs greater than 30 percent include indoor use

^b As shortages approach 100 percent the value approaches infinity assuming there are not alternatives available; however, we assume that communities would begin to have water delivered by tanker truck at an estimated cost of \$24,000 per acre-foot when shortages breached 85 percent.

Commercial Businesses

Effects of water shortages on commercial sectors were estimated in a fashion similar to other business sectors meaning that water shortages would affect the ability of these businesses to operate. This is particularly true for "water intensive" commercial sectors that are need large amounts of water (in addition to potable and sanitary water) to provide their services. These include:

- car-washes,
- laundry and cleaning facilities,
- sports and recreation clubs and facilities including race tracks,
- amusement and recreation services,
- hospitals and medical facilities,
- hotels and lodging places, and
- eating and drinking establishments.

A key assumption is that commercial operations would not be affected until water shortages were at least 50 percent of total municipal demand. In other words, we assume that residential water consumers would reduce water use including all non-essential uses before businesses were affected.

An example will illustrate the breakdown of municipal water needs and the overall approach to estimating impacts of municipal needs. Assume City A experiences an unexpected shortage of 50 acrefeet per year when their demands are 200 acre-feet per year. Thus, shortages are only 25 percent of total municipal use and residents of City A could eliminate needs by restricting landscape irrigation. City B, on the other hand, has a deficit of 150 acre-feet in 2020 and a projected demand of 200 acre-feet. Thus, total shortages are 75 percent of total demand. Emergency outdoor and some indoor conservation measures could eliminate 50 acre-feet of projected needs, yet 50 acre-feet would still remain. To eliminate" the remaining 50 acre-feet water intensive commercial businesses would have to curtail operations or shut down completely.

Three other areas were considered when analyzing municipal water shortages: 1) lost revenues to water utilities, 2) losses to the horticultural and landscaping industries stemming for reduction in water available for landscape irrigation, and 3) lost revenues and related economic impacts associated with reduced water related recreation.

Water Utility Revenues

Estimating lost water utility revenues was straightforward. We relied on annual data from the "Water and Wastewater Rate Survey" published annually by the Texas Municipal League to calculate an average value per acre-foot for water and sewer. For water revenues, average retail water and sewer rates multiplied by total water needs served as a proxy. For lost wastewater, total unmet needs were adjusted for return flow factor of 0.60 and multiplied by average sewer rates for the region. Needs reported as "county-other" were excluded under the presumption that these consist primarily of self-supplied water uses. In addition, 15 percent of water demand and needs are considered non-billed or "unaccountable" water that comprises things such as leakages and water for municipal government functions (e.g., fire departments). Lost tax receipts are based on current rates for the "miscellaneous gross receipts tax, "which the state collects from utilities located in most incorporated cities or towns in Texas. We do not include lost water utility revenues when aggregating impacts of municipal water shortages to regional and state levels to prevent double counting.

Horticultural and Landscaping Industry

The horticultural and landscaping industry, also referred to as the "green Industry," consists of businesses that produce, distribute and provide services associated with ornamental plants, landscape and garden supplies and equipment. Horticultural industries often face big losses during drought. For example, the recent drought in the Southeast affecting the Carolinas and Georgia horticultural and landscaping businesses had a harsh year. Plant sales were down, plant mortality increased, and watering costs increased. Many businesses were forced to close locations, lay off employees, and even file for bankruptcy. University of Georgia economists put statewide losses for the industry at around \$3.2 billion during the 3-year drought that ended in 2008. Municipal restrictions on outdoor watering play a significant role. During drought, water restrictions coupled with persistent heat has a psychological effect on homeowners that reduces demands for landscaping products and services. Simply put, people were afraid to spend any money on new plants and landscaping.

In Texas, there do not appear to be readily available studies that analyze the economic effects of water shortages on the industry. However, authors of this report believe negative impacts do and would result in restricting landscape irrigation to municipal water consumers. The difficulty in measuring them is two-fold. First, as noted above, data and research for these types of impacts that focus on Texas are limited; and second, economic data provided by IMPLAN do not disaggregate different sectors of the green industry to a level that would allow for meaningful and defensible analysis. ¹⁸
Recreational Impacts

Recreational businesses often suffer when water levels and flows in rivers, springs and reservoirs fall significantly during drought. During droughts, many boat docks and lake beaches are forced to close, leading to big losses for lakeside business owners and local communities. Communities adjacent to popular river and stream destinations such as Comal Springs and the Guadalupe River also see their business plummet when springs and rivers dry up. Although there are many examples of businesses that have suffered due to drought, dollar figures for drought-related losses to the recreation and tourism industry are not readily available, and very difficult to measure without extensive local surveys. Thus, while they are important, economic impacts are not measured in this study.

Table 7 summarizes impacts of municipal water shortages at differing levels of magnitude, and shows the ranges of economic costs or losses per acre-foot of shortage for each level.

¹⁷ Williams, D. "Georgia landscapers eye rebound from Southeast drought." Atlanta Business Chronicle, Friday, June 19, 2009

¹⁸ Economic impact analyses prepared by the TWDB for 2006 regional water plans did include estimates for the horticultural industry. However, year 2000 and prior IMPLAN data were disaggregated to a finer level. In the current dataset (2006), the sector previously listed as "Landscaping and Horticultural Services" (IMPLAN Sector 27) is aggregated into "Services to Buildings and Dwellings" (IMPLAN Sector 458).

Table 7: Impacts of Municipal Water Shortages at Different Magnitudes of Shortages				
Water shortages as percent of total municipal demands	Impacts	Economic costs per acre-foot*		
0-30%	 ✓ Lost water utility revenues ✓ Restricted landscape irrigation and non- essential water uses 	\$730 - \$2,040		
30-50%	 ✓ Lost water utility revenues ✓ Elimination of landscape irrigation and non-essential water uses ✓ Rationing of indoor use 	\$2,040 - \$10,970		
>50%	 ✓ Lost water utility revenues ✓ Elimination of landscape irrigation and non-essential water uses ✓ Rationing of indoor use ✓ Restriction or elimination of commercial water use ✓ Importing water by tanker truck 	\$10,970 - varies

1.1.4 Industrial Water User Groups

Manufacturing

Impacts to manufacturing were estimated by distributing water shortages among industrial sectors at the county level. For example, if a planning group estimates that during a drought of record water supplies in County A would only meet 50 percent of total annual demands for manufactures in the county, we reduced output for each sector by 50 percent. Since projected manufacturing demands are based on TWDB Water Uses Survey data for each county, we only include IMPLAN sectors represented in the TWBD survey database. Some sectors in IMPLAN databases are not part of the TWDB database given that they use relatively small amounts of water - primarily for on-site sanitation and potable purposes. To maintain consistency between IMPLAN and TWDB databases, Standard Industrial Classification (SIC) codes both databases were cross referenced in county with shortages. Non-matches were excluded when calculating direct impacts.

Mining

The process of mining is very similar to that of manufacturing. We assume that within a given county, shortages would apply equally to relevant mining sectors, and IMPLAN sectors are cross referenced with TWDB data to ensure consistency.

In Texas, oil and gas extraction and sand and gravel (aggregates) operations are the primary mining industries that rely on large volumes of water. For sand and gravel, estimated output reductions are straightforward; however, oil and gas is more complicated for a number of reasons. IMPLAN does not necessarily report the physical extraction of minerals by geographic local, but rather the sales revenues reported by a particular corporation.

For example, at the state level revenues for IMPLAN sector 19 (oil and gas extraction) and sector 27 (drilling oil and gas wells) totals \$257 billion. Of this, nearly \$85 billion is attributed to Harris County. However, only a very small fraction (less than one percent) of actual production takes place in the county. To measure actual potential losses in well head capacity due to water shortages, we relied on county level production data from the Texas Railroad Commission (TRC) and average well-head market prices for crude and gas to estimate lost revenues in a given county. After which, we used to IMPLAN ratios to estimate resultant losses in income and employment.

Other considerations with respect to mining include:

- 1) Petroleum and gas extraction industry only uses water in significant amounts for secondary recovery. Known in the industry as enhanced or water flood extraction, secondary recovery involves pumping water down injection wells to increase underground pressure thereby pushing oil or gas into other wells. IMPLAN output numbers do not distinguish between secondary and non-secondary recovery. To account for the discrepancy, county-level TRC data that show the proportion of barrels produced using secondary methods were used to adjust IMPLAN data to reflect only the portion of sales attributed to secondary recovery.
- 2) A substantial portion of output from mining operations goes directly to businesses that are classified as manufacturing in our schema. Thus, multipliers measuring backward linkages for a given manufacturer might include impacts to a supplying mining operation. Care was taken not to double count in such situations if both a mining operation and a manufacturer were reported as having water shortages.

Steam-electric

At minimum without adequate cooling water, power plants cannot safely operate. As water availability falls below projected demands, water levels in lakes and rivers that provide cooling water would also decline. Low water levels could affect raw water intakes and outfalls at electrical generating units in several ways. For one, power plants are regulated by thermal emission guidelines that specify the maximum amount of heat that can go back into a river or lake via discharged cooling water. Low water levels could result in permit compliance issues due to reduced dilution and dispersion of heat and subsequent impacts on aquatic biota near outfalls. However, the primary concern would be a loss of head (i.e., pressure) over intake structures that would decrease flows through intake tunnels. This would affect safety related pumps, increase operating costs and/or result in sustained shut-downs. Assuming plants did shutdown, they would not be able to generate electricity.

¹⁹ Section 316 (b) of the Clean Water Act requires that thermal wastewater discharges do not harm fish and other wildlife.

Among all water use categories steam-electric is unique and cautions are needed when applying methods used in this study. Measured changes to an economy using input-output models stem directly from changes in sales revenues. In the case of water shortages, one assumes that businesses will suffer lost output if process water is in short supply. For power generation facilities this is true as well. However, the electric services sector in IMPLAN represents a corporate entity that may own and operate several electrical generating units in a given region. If one unit became inoperable due to water shortages, plants in other areas or generation facilities that do not rely heavily on water such as gas powered turbines might be able to compensate for lost generating capacity. Utilities could also offset lost production via purchases on the spot market. Thus, depending upon the severity of the shortages and conditions at a given electrical generating unit, energy supplies for local and regional communities could be maintained. But in general, without enough cooling water, utilities would have to throttle back plant operations, forcing them to buy or generate more costly power to meet customer demands.

Measuring impacts end users of electricity is not part of this study as it would require extensive local and regional level analysis of energy production and demand. To maintain consistency with other water user groups, impacts of steam-electric water shortages are measured in terms of lost revenues (and hence income) and jobs associated with shutting down electrical generating units.

1.2 Social Impacts of Water Shortages

As the name implies, the effects of water shortages can be social or economic. Distinctions between the two are both semantic and analytical in nature – more so analytic in the sense that social impacts are harder to quantify. Nevertheless, social effects associated with drought and water shortages are closely tied to economic impacts. For example, they might include:

- demographic effects such as changes in population,
- disruptions in institutional settings including activity in schools and government,
- conflicts between water users such as farmers and urban consumers,
- health-related low-flow problems (e.g., cross-connection contamination, diminished sewage flows, increased pollutant concentrations),
- mental and physical stress (e.g., anxiety, depression, domestic violence),
- public safety issues from forest and range fires and reduced fire fighting capability,
- increased disease caused by wildlife concentrations,
- loss of aesthetic and property values, and
- reduced recreational opportunities.²¹

20

²⁰ Today, most utilities participate in large interstate "power pools" and can buy or sell electricity "on the grid" from other utilities or power marketers. Thus, assuming power was available to buy, and assuming that no contractual or physical limitations were in place such as transmission constraints; utilities could offset lost power that resulted from waters shortages with purchases via the power grid.

²¹ Based on information from the website of the National Drought Mitigation Center at the University of Nebraska Lincoln. Available online at: http://www.drought.unl.edu/risk/impacts.htm. See also, Vanclay, F. "Social Impact Assessment." in Petts, J. (ed) International Handbook of Environmental Impact Assessment. 1999.

Social impacts measured in this study focus strictly on demographic effects including changes in population and school enrollment. Methods are based on demographic projection models developed by the Texas State Data Center and used by the TWDB for state and regional water planning. Basically, the social impact model uses results from the economic component of the study and assesses how changes in labor demand would affect migration patterns in a region. Declines in labor demand as measured using adjusted IMPLAN data are assumed to affect net economic migration in a given regional water planning area. Employment losses are adjusted to reflect the notion that some people would not relocate but would seek employment in the region and/or public assistance and wait for conditions to improve. Changes in school enrollment are simply the proportion of lost population between the ages of 5 and 17.

2.0 Results

Section 2 presents the results of the analysis at the regional level. Included are baseline economic data for each water use category, and estimated economic impacts of water shortages for water user groups with reported deficits. According to the 2011 *Brazos G Regional Water Plan*, during severe drought irrigation, municipal, manufacturing, mining and steam-electric water user groups would experience water shortages in the absence of new water management strategies.

2.1 Overview of Regional Economy

On an annual basis, the Region G economy generates slightly more than \$46 billion in gross state product for Texas (\$43 billion in income and \$3 billion in business taxes) and supports 744,230 jobs (Table 8). Generating about \$10 billion worth of income per year, agriculture, manufacturing, and mining are the primary base economic sectors in the region. ²² Municipal sectors also generate substantial amounts of income, nearly \$32 billion per year, and are major employers in the region. While municipal sectors are the largest employer and source of wealth, many businesses that make up the municipal category such as restaurants and retail stores are non-basic industries meaning they exist to provide services to people who work would in base industries such as manufacturing, agriculture and mining. In other words, without base industries such agriculture, many municipal jobs in the region would not exist.

-

²² Base industries are those that supply markets outside of the region. These industries are crucial to the local economy and are called the economic base of a region. Appendix A shows how IMPLAN's 529 sectors were allocated to water use category, and shows economic data for each sector.

Table 8: The Region G Economy by Water User Group (\$millions)*						
Water Use Category	Total sales	Intermediate sales	Final sales	Jobs	Income	Business taxes
Irrigation	\$159.73	\$40.30	\$119.46	2,784	\$90.47	\$2.64
Livestock	\$2,659.43	\$1,522.98	\$1,136.45	34,292	\$307.13	\$42.31
Manufacturing	\$19,735.61	\$3,175.38	\$16,560.23	96,518	\$6,587.75	\$141.50
Mining	\$5,585.21	\$3,026.40	\$2,558.82	15,034	\$3,128.40	\$288.10
Steam-electric	\$1,680.28	\$472.70	\$1,207.58	3,229	\$1,166.79	\$199.10
Municipal	\$49,735.51	\$10,714.82	\$39,020.69	592,373	\$31,871.14	\$2,292.58
Regional total	\$79,555.78	\$18,952.58	\$60,603.23	744,230	\$43,151.68	\$2,966.22

^{*}Appendix 1 displays data for individual IMPLAN sectors that make up each water use category. Based on data from the Texas Water Development Board, and year 2006 data from the Minnesota IMPLAN Group, Inc.

2.2 Impacts of Agricultural Water Shortages

According to the 2011 *Brazos G Regional Water Plan*, during severe drought several counties in the region would experiences shortages of irrigation water. In 2010, shortages range from about 34 to 100 percent of annual irrigation demands, and farmers would be short nearly 59,700 acre-feet in 2010 and about 47,180 acre-feet in 2060. Shortages of these magnitudes would reduce gross state product (income plus state and local business taxes) by about \$26 million in 2010 and \$20 million in 2060 with potential job losses ranging from 463 to 360.

Table 9: Economic Impacts of Water Shortages for Irrigation Water User Groups (\$millions)				
Decade	Lost income from reduced crop production ^a	Lost state and local tax revenues from reduced crop production	Lost jobs from reduced crop	
2010	\$24.80	\$1.32	463	
2020	\$23.59	\$1.26	441	
2030	\$22.42	\$1.20	420	
2040	\$21.27	\$1.14	400	
2050	\$20.16	\$1.08	380	
2060	\$19.07	\$1.02	360	

^{*}Changes to income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

2.3 Impacts of Municipal Water Shortages

Water shortages are projected to occur in a significant number of communities in the region. Deficits range from approximately 14 to 100 percent of total annual water use. At the regional level, the estimated economic value of domestic water shortages totals \$238 million in 2010 and \$2,722 million in 2060 (Table 10). Municipal shortages would reduce gross state product (income plus taxes) by an estimated \$58 million in 2010 and \$1,868 million in 2060.

	Table 10: Economic Impacts of Water Shortages for Municipal Water User Groups (\$millions)						
Decade	Monetary value of domestic water shortages	Lost income from reduced commercial business activity*	Lost state and local taxes from reduced commercial business activity	Lost jobs from reduced commercial business activity	Lost water utility revenues		
2010	\$238.10	\$51.38	\$6.93	1,652	\$50.63		
2020	\$751.61	\$614.12	\$58.25	14,766	\$120.77		
2030	\$1,041.76	\$748.99	\$73.96	17,326	\$167.54		
2040	\$1,446.38	\$1,088.72	\$114.32	23,734	\$236.80		
2050	\$2,028.11	\$1,364.62	\$146.91	29,429	\$310.27		
2060	\$2,722.65	\$1,684.30	\$184.81	35,840	\$390.48		

^{*}Changes to Income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

2.4 Impacts of Manufacturing Water Shortages

Manufacturing water shortages in the region are projected to occur in Johnson, Lampasas, Limestone, Nolan and Williamson counties. In 2010, the Brazos G planning group estimates that these manufacturers would be short about 5,855 acre-feet; and by 2060, this figure increases to 12,236 acrefeet. Shortages of these magnitudes would reduce gross state product (income plus taxes) by an estimated \$691 million in 2010 and \$1,521 million in 2060 (Table 11).

Decade	Table 11: Economic Impacts of Water Impa	Lost state and local business tax revenues due to reduced manufacturing output	Lost jobs due to reduced manufacturing output	
2010	\$644.37	\$46.61	8,577	
2020	\$797.15	\$57.15	10,566	
2030	\$958.35	\$68.56	12,683	
2040	\$1,121.77	\$80.13	14,829	
2050	\$1,268.72	\$90.54	16,759	
2060	\$1,419.33	\$101.24	18,716	

^{*}Changes to Income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

2.5 Impacts of Mining Water Shortages

Ming water shortages in the region are projected to occur in Milam, Nolan, Stephens, and Williamson counties, and would primarily affect the oil and gas and aggregates operations. In total, shortages would reduce gross state product by \$153 million in 2010 and \$198 in 2060 (Table 12).

	Table 12: Economic Impacts of Water Shortages for Mining Water User Groups (\$millions)					
Decade	Lost income due to reduced mining output	Lost state and local business tax revenues due to reduced mining output	Lost jobs due to reduced mining output			
2010	\$140.88	\$11.96	682			
2020	\$154.49	\$13.21	760			
2030	\$161.48	\$13.90	807			
2040	\$168.13	\$14.55	852			
2050	\$174.88	\$15.22	897			
2060	\$181.91	\$15.86	937			

^{*}Changes to Income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

2.6 Impacts of Steam-electric Water Shortages

Water shortages for steam-electric water user groups are projected to occur in Bell, Bosque, Grimes, Johnson, Limestone, Milam, Nolan, Robertson, and Somervell counties, and would reduce gross state product by \$1,176 million dollars in 2010, and \$5,624 million 2060 (Table 13).

	Table 13: Economic Impacts of Water Shortages for Steam-electric Water User Groups (\$millions)						
Decade	Lost income due to reduced electrical generation	Lost state and local business tax revenues due to reduced electrical generation	Lost jobs due to reduced electrical generation				
2010	\$1,028.57	\$147.64	3,325				
2020	\$2,785.64	\$400.29	7,127				
2030	\$3,729.69	\$535.87	8,497				
2040	\$3,897.52	\$567.53	9,081				
2050	\$4,354.88	\$639.09	10,967				
2060	\$4,899.18	\$724.41	17,264				

^{*}Changes to Income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

2.7 Social Impacts of Water Shortages

As discussed previously, estimated social impacts focus on changes in population and school enrollment. In 2010, estimated population losses total 15,801 with corresponding reductions in school enrollment of 4,457 students (Table 14). In 2060, population in the region would decline by 71,604 people and school enrollment would fall by 20,314 students.

Table 14: Social Impacts of Water Shortages (2010-2060)					
Year	Population Losses	Declines in School Enrollment			
2010	15,801	4,457			
2020	35,645	10,112			
2030	41,465	11,764			
2040	51,910	14,727			
2050	61,309	17,393			
2060	71,604	20,314			

2.8 Distribution of Impacts by Major River Basin

Administrative rules require that impacts are presented by both planning region and major river basin. To meet rule requirements, impacts were allocated among basins based on the distribution of water shortages in relevant basins. For example, if 50 percent of water shortages in River Basin A and 50 percent occur in River Basin B, then impacts were split equally among the two basins. Table 14 displays the results for the Brazos G planning area.

Water Use	2010	2020	2030	2040	2050	2060

Re:

Socioeconomic Impact Analysis of Not Meeting Water Needs for the 2011 Region H

Regional Water Plan

Dear Judge Evans:

We have received your request for technical assistance to complete the socioeconomic impact analysis of not meeting water needs. In response, enclosed is a report that describes our methodology and presents the results. Section 1 provides an overview of the methodology, and Section 2 presents results for at the regional level, and Appendix 2 show results for individual water user groups.

If you have any questions or comments, please feel free to contact me at (512) 463-7928 or by email at stuart.norvell@twdb.state.tx.us.

Sincerely.

Stuart Norvell

Manager, Water Planning Research and Analysis

Water Resources Planning Division

Introduction

Water shortages during drought would likely curtail or eliminate economic activity in business and industries reliant on water. For example, without water farmers cannot irrigate; refineries cannot produce gasoline, and paper mills cannot make paper. Unreliable water supplies would not only have an immediate and real impact on existing businesses and industry, but they could also adversely affect economic development in Texas. From a social perspective, water supply reliability is critical as well. Shortages would disrupt activity in homes, schools and government and could adversely affect public health and safety. For all of the above reasons, it is important to analyze and understand how restricted water supplies during drought could affect communities throughout the state.

Administrative rules require that regional water planning groups evaluate the impacts of not meeting water needs as part of the regional water planning process, and rules direct TWDB staff to provide technical assistance: "The executive administrator shall provide available technical assistance to the regional water planning groups, upon request, on water supply and demand analysis, including methods to evaluate the social and economic impacts of not meeting needs" [(§357.7 (4)(A)]. Staff of the TWDB's Water Resources Planning Division designed and conducted this report in support of the Region H Regional Water Planning Group (Region H).

This document summarizes the results of our analysis and discusses the methodology used to generate the results. Section 1 outlines the overall methodology and discusses approaches and assumptions specific to each water use category (i.e., irrigation, livestock, mining, steam-electric, municipal and manufacturing). Section 2 presents the results for each category where shortages are reported at the regional planning area level and river basin level. Results for individual water user groups are not presented, but are available upon request.

1. Methodology

Section 1 provides a general overview of how economic and social impacts were measured. In addition, it summarizes important clarifications, assumptions and limitations of the study.

1.1 Economic Impacts of Water Shortages

1.1.1 General Approach

Economic analysis as it relates to water resources planning generally falls into two broad areas. Supply side analysis focuses on costs and alternatives of developing new water supplies or implementing programs that provide additional water from current supplies. Demand side analysis concentrates on impacts or benefits of providing water to people, businesses and the environment. Analysis in this report focuses strictly on demand side impacts. When analyzing the economic impacts of water shortages as defined in Texas water planning, three potential scenarios are possible:

Scenario 1 involves situations where there are physical shortages of raw surface or groundwater due to drought of record conditions. For example, City A relies on a reservoir with average conservation storage of 500 acre-feet per year and a firm yield of 100 acre feet. In 2010, the city uses about 50 acre-feet per year, but by 2030 their demands are expected to increase to 200 acre-feet. Thus, in 2030 the reservoir would not have enough water to meet the city's demands, and people would experience a shortage of 100 acre-feet assuming drought of record conditions. Under normal or average climatic conditions, the reservoir would likely be able to provide reliable water supplies well beyond 2030.

- 2) Scenario 2 is a situation where despite drought of record conditions, water supply sources can meet existing use requirements; however, limitations in water infrastructure would preclude future water user groups from accessing these water supplies. For example, City B relies on a river that can provide 500 acre-feet per year during drought of record conditions and other constraints as dictated by planning assumptions. In 2010, the city is expected to use an estimated 100 acre-feet per year and by 2060 it would require no more than 400 acre-feet. But the intake and pipeline that currently transfers water from the river to the city's treatment plant has a capacity of only 200 acre-feet of water per year. Thus, the city's water supplies are adequate even under the most restrictive planning assumptions, but their conveyance system is too small. This implies that at some point perhaps around 2030 infrastructure limitations would constrain future population growth and any associated economic activity or impacts.
- 3) Scenario 3 involves water user groups that rely primarily on aquifers that are being depleted. In this scenario, projected and in some cases existing demands may be unsustainable as groundwater levels decline. Areas that rely on the Ogallala aquifer are a good example. In some communities in the region, irrigated agriculture forms a major base of the regional economy. With less irrigation water from the Ogallala, population and economic activity in the region could decline significantly assuming there are no offsetting developments.

Assessing the social and economic effects of each of the above scenarios requires various levels and methods of analysis and would generate substantially different results for a number of reasons; the most important of which has to do with the time frame of each scenario. Scenario 1 falls into the general category of static analysis. This means that models would measure impacts for a small interval of time such as a drought. Scenarios 2 and 3, on the other hand imply a dynamic analysis meaning that models are concerned with changes over a much longer time period.

Since administrative rules specify that planning analysis be evaluated under drought of record conditions (a static and random event), socioeconomic impact analysis developed by the TWDB for the state water plan is based on assumptions of Scenario 1. Estimated impacts under scenario 1 are point estimates for years in which needs are reported (2010, 2020, 2030, 2040, 2050 and 2060). They are independent and distinct "what if" scenarios for a particular year and shortages are assumed to be temporary events resulting from drought of record conditions. Estimated impacts measure what would happen if water user groups experience water shortages for a period of one year.

The TWDB recognize that dynamic models may be more appropriate for some water user groups; however, combining approaches on a statewide basis poses several problems. For one, it would require a complex array of analyses and models, and might require developing supply and demand forecasts under "normal" climatic conditions as opposed to drought of record conditions. Equally important is the notion that combining the approaches would produce inconsistent results across regions resulting in a so-called "apples to oranges" comparison.

A variety tools are available to estimate economic impacts, but by far, the most widely used today are input-output models (IO models) combined with social accounting matrices (SAMs). Referred to as IO/SAM models, these tools formed the basis for estimating economic impacts for agriculture (irrigation and livestock water uses) and industry (manufacturing, mining, steam-electric and commercial business activity for municipal water uses).

Since the planning horizon extends through 2060, economic variables in the baseline are adjusted in accordance with projected changes in demographic and economic activity. Growth rates for municipal water use sectors (i.e., commercial, residential and institutional) are based on TWDB population forecasts. Future values for manufacturing, agriculture, and mining and steam-electric activity are based on the same underlying economic forecasts used to estimate future water use for each category.

The following steps outline the overall process.

Step 1: Generate IO/SAM Models and Develop Economic Baseline

IO/SAM models were estimated using propriety software known as IMPLAN PROTM (Impact for Planning Analysis). IMPLAN is a modeling system originally developed by the U.S. Forestry Service in the late 1970s. Today, the Minnesota IMPLAN Group (MIG Inc.) owns the copyright and distributes data and software. It is probably the most widely used economic impact model in existence. IMPLAN comes with databases containing the most recently available economic data from a variety of sources. Using IMPLAN software and data, transaction tables conceptually similar to the one discussed previously were estimated for each county in the region and for the region as a whole. Each transaction table contains 528 economic sectors and allows one to estimate a variety of economic statistics including:

- total sales total production measured by sales revenues;
- intermediate sales sales to other businesses and industries within a given region;
- final sales sales to end users in a region and exports out of a region;
- employment number of full and part-time jobs (annual average) required by a given industry including self-employment;
- regional income total payroll costs (wages and salaries plus benefits) paid by industries, corporate income, rental income and interest payments; and
- **business taxes** sales, excise, fees, licenses and other taxes paid during normal operation of an industry (does not include income taxes).

TWDB analysts developed an economic baseline containing each of the above variables using year 2000 data. Since the planning horizon extends through 2060, economic variables in the baseline were allowed to change in accordance with projected changes in demographic and economic activity. Growth rates for municipal water use sectors (i.e., commercial, residential and institutional) are based on TWDB population forecasts. Projections for manufacturing, agriculture, and mining and steam-electric activity are based on the same underlying economic forecasts used to estimate future water use for each category. Monetary impacts in future years are reported in constant year 2006 dollars.

It is important to stress that employment, income and business taxes are the most useful variables when comparing the relative contribution of an economic sector to a regional economy. Total sales as reported in IO/SAM models are less desirable and can be misleading because they include sales to other industries in the region for use in the production of other goods. For example, if a mill buys grain from local farmers and uses it to produce feed, sales of both the processed feed and raw corn are counted

¹The IMPLAN database consists of national level technology matrices based on benchmark input-output accounts generated by the U.S. Bureau of Economic Analysis and estimates of final demand, final payments, industry output and employment for various economic sectors. IMPLAN regional data (i.e. states, a counties or groups of counties within a state) are divided into two basic categories: 1) data on an industry basis including value-added, output and employment, and 2) data on a commodity basis including final demands and institutional sales. State-level data are balanced to national totals using a matrix ratio allocation system and county data are balanced to state totals.

as "output" in an IO model. Thus, total sales double-count or overstate the true economic value of goods and services produced in an economy. They are not consistent with commonly used measures of output such as Gross National Product (GNP), which counts only final sales.

Another important distinction relates to terminology. Throughout this report, the term *sector* refers to economic subdivisions used in the IMPLAN database and resultant input-output models (528 individual sectors based on Standard Industrial Classification Codes). In contrast, the phrase *water use category* refers to water user groups employed in state and regional water planning including irrigation, livestock, mining, municipal, manufacturing and steam electric. Each IMPLAN sector was assigned to a specific water use category.

Step 2: Estimate Direct and Indirect Economic Impacts of Water Needs

Direct impacts are reductions in output by sectors experiencing water shortages. For example, without adequate cooling and process water a refinery would have to curtail or cease operation, car washes may close, or farmers may not be able to irrigate and sales revenues fall. Indirect impacts involve changes in inter-industry transactions as supplying industries respond to decreased demands for their services, and how seemingly non-related businesses are affected by decreased incomes and spending due to direct impacts. For example, if a farmer ceases operations due to a lack of irrigation water, they would likely reduce expenditures on supplies such as fertilizer, labor and equipment, and businesses that provide these goods would suffer as well.

Direct impacts accrue to immediate businesses and industries that rely on water and without water industrial processes could suffer. However, output responses may vary depending upon the severity of shortages. A small shortage relative to total water use would likely have a minimal impact, but large shortages could be critical. For example, farmers facing small shortages might fallow marginally productive acreage to save water for more valuable crops. Livestock producers might employ emergency culling strategies, or they may consider hauling water by truck to fill stock tanks. In the case of manufacturing, a good example occurred in the summer of 1999 when Toyota Motor Manufacturing experienced water shortages at a facility near Georgetown, Kentucky. As water levels in the Kentucky River fell to historic lows due to drought, plant managers sought ways to curtail water use such as reducing rinse operations to a bare minimum and recycling water by funneling it from paint shops to boilers. They even considered trucking in water at a cost of 10 times what they were paying. Fortunately, rains at the end of the summer restored river levels, and Toyota managed to implement cutbacks without affecting production, but it was a close call. If rains had not replenished the river, shortages could have severely reduced output.

To account for uncertainty regarding the relative magnitude of impacts to farm and business operations, the following analysis employs the concept of elasticity. Elasticity is a number that shows how a change in one variable will affect another. In this case, it measures the relationship between a percentage reduction in water availability and a percentage reduction in output. For example, an elasticity of 1.0 indicates that a 1.0 percent reduction in water availability would result in a 1.0 percent reduction in

² Royal, W. "High And Dry - Industrial Centers Face Water Shortages." in Industry Week, Sept, 2000.

³ The efforts described above are not planned programmatic or long-term operational changes. They are emergency measures that individuals might pursue to alleviate what they consider a temporary condition. Thus, they are not characteristic of long-term management strategies designed to ensure more dependable water supplies such as capital investments in conservation technology or development of new water supplies.

economic output. An elasticity of 0.50 would indicate that for every 1.0 percent of unavailable water, output is reduced by 0.50 percent and so on. Output elasticities used in this study are:⁴

- if water needs are 0 to 5 percent of total water demand, no corresponding reduction in output is assumed;
- if water needs are 5 to 30 percent of total water demand, for each additional one percent of water need that is not met, there is a corresponding 0.50 percent reduction in output;
- if water needs are 30 to 50 percent of total water demand, for each additional one percent of water need that is not met, there is a corresponding 0.75 percent reduction in output; and
- if water needs are greater than 50 percent of total water demand, for each additional one percent of water need that is not met, there is a corresponding 1.0 percent (i.e., a proportional reduction).

In some cases, elasticities are adjusted depending upon conditions specific to a given water user group.

Once output responses to water shortages were estimated, direct impacts to total sales, employment, regional income and business taxes were derived using regional level economic multipliers estimating using IO/SAM models. The formula for a given IMPLAN sector is:

$$D_{i,t} = Q_{i,t} *_{,} S_{i,t} *_{,} E_{Q} *_{,} RFD_{i} *_{,} DM_{i(Q,L,I,T)}$$

where:

 $D_{i,t}$ = direct economic impact to sector i in period t

 $Q_{i,t}$ = total sales for sector *i* in period *t* in an affected county

RFD_{i.} = ratio of final demand to total sales for sector *i* for a given region

 $S_{i,t}$ = water shortage as percentage of total water use in period t

 E_0 = elasticity of output and water use

 $DM_{i(L, I, T)}$ = direct output multiplier coefficients for labor (L), income (I) and taxes (T) for sector i.

Secondary impacts were derived using the same formula used to estimate direct impacts; however, indirect multiplier coefficients are used. Methods and assumptions specific to each water use sector are discussed in Sections 1.1.2 through 1.1.4.

⁴ Elasticities are based on one of the few empirical studies that analyze potential relationships between economic output and water shortages in the United States. The study, conducted in California, showed that a significant number of industries would suffer reduced output during water shortages. Using a survey based approach researchers posed two scenarios to different industries. In the first scenario, they asked how a 15 percent cutback in water supply lasting one year would affect operations. In the second scenario, they asked how a 30 percent reduction lasting one year would affect plant operations. In the case of a 15 percent shortage, reported output elasticities ranged from 0.00 to 0.76 with an average value of 0.25. For a 30 percent shortage, elasticities ranged from 0.00 to 1.39 with average of 0.47. For further information, see, California Urban Water Agencies, "Cost of Industrial Water Shortages," Spectrum Economics, Inc. November, 1991.

General Assumptions and Clarification of the Methodology

As with any attempt to measure and quantify human activities at a societal level, assumptions are necessary and every model has limitations. Assumptions are needed to maintain a level of generality and simplicity such that models can be applied on several geographic levels and across different economic sectors. In terms of the general approach used here several clarifications and cautions are warranted:

- 1. Shortages as reported by regional planning groups are the starting point for socioeconomic analyses.
- 2. Estimated impacts are point estimates for years in which needs are reported (i.e., 2010, 2020, 2030, 2040, 2050 and 2060). They are independent and distinct "what if" scenarios for each particular year and water shortages are assumed to be temporary events resulting from severe drought conditions combined with infrastructure limitations. In other words, growth occurs and future shocks are imposed on an economy at 10-year intervals and resultant impacts are measured. Given, that reported figures are not cumulative in nature, it is inappropriate to sum impacts over the entire planning horizon. Doing so, would imply that the analysis predicts that drought of record conditions will occur every ten years in the future, which is not the case. Similarly, authors of this report recognize that in many communities needs are driven by population growth, and in the future total population will exceed the amount of water available due to infrastructure limitations, regardless of whether or not there is a drought. This implies that infrastructure limitations would constrain economic growth. However, since needs as defined by planning rules are based upon water supply and demand under the assumption of drought of record conditions, it improper to conduct economic analysis that focuses on growth related impacts over the planning horizon. Figures generated from such an analysis would presume a 50-year drought of record, which is unrealistic. Estimating lost economic activity related to constraints on population and commercial growth due to lack of water would require developing water supply and demand forecasts under "normal" or "most likely" future climatic conditions.
- 3. While useful for planning purposes, this study is not a benefit-cost analysis. Benefit cost analysis is a tool widely used to evaluate the economic feasibility of specific policies or projects as opposed to estimating economic impacts of unmet water needs. Nevertheless, one could include some impacts measured in this study as part of a benefit cost study if done so properly. Since this is not a benefit cost analysis, future impacts are not weighted differently. In other words, estimates are not discounted. If used as a measure of economic benefits, one should incorporate a measure of uncertainty into the analysis. In this type of analysis, a typical method of discounting future values is to assign probabilities of the drought of record recurring again in a given year, and weight monetary impacts accordingly. This analysis assumes a probability of one.
- 4. IO multipliers measure the strength of backward linkages to supporting industries (i.e., those who sell inputs to an affected sector). However, multipliers say nothing about forward linkages consisting of businesses that purchase goods from an affected sector for further processing. For example, ranchers in many areas sell most of their animals to local meat packers who process animals into a form that consumers ultimately see in grocery stores and restaurants. Multipliers do not capture forward linkages to meat packers, and since meat packers sell livestock purchased from ranchers as "final sales," multipliers for the ranching sector do fully account for all losses to a region's economy. Thus, as mentioned previously, in some cases closely linked sectors were moved from one water use category to another.
- 5. Cautions regarding interpretations of direct and secondary impacts are warranted. IO/SAM multipliers are based on "fixed-proportion production functions," which basically means that input use including labor moves in lockstep fashion with changes in levels of output. In a

scenario where output (i.e., sales) declines, losses in the immediate sector or supporting sectors could be much less than predicted by an IO/SAM model for several reasons. For one, businesses will likely expect to continue operating so they might maintain spending on inputs for future use; or they may be under contractual obligations to purchase inputs for an extended period regardless of external conditions. Also, employers may not lay-off workers given that experienced labor is sometimes scarce and skilled personnel may not be readily available when water shortages subside. Lastly people who lose jobs might find other employment in the region. As a result, direct losses for employment and secondary losses in sales and employment should be considered an upper bound. Similarly, since projected population losses are based on reduced employment in the region, they should be considered an upper bound as well.

- 6. IO models are static. Models and resultant multipliers are based upon the structure of the U.S. and regional economies in 2006. In contrast, water shortages are projected to occur well into the future. Thus, the analysis assumes that the general structure of the economy remains the same over the planning horizon, and the farther out into the future we go, this assumption becomes less reliable.
- 7. Impacts are annual estimates. If one were to assume that conditions persisted for more than one year, figures should be adjusted to reflect the extended duration. The drought of record in most regions of Texas lasted several years.
- 8. Monetary figures are reported in constant year 2006 dollars.

1.1.2 Impacts to Agriculture

Irrigated Crop Production

The first step in estimating impacts to irrigation required calculating gross sales for IMPLAN crop sectors. Default IMPLAN data do not distinguish irrigated production from dry-land production. Once gross sales were known other statistics such as employment and income were derived using IMPLAN direct multiplier coefficients. Gross sales for a given crop are based on two data sources:

- 1) county-level statistics collected and maintained by the TWDB and the USDA Farm Services Agency (FSA) including the number of irrigated acres by crop type and water application per acre, and
- 2) regional-level data published by the Texas Agricultural Statistics Service (TASS) including prices received for crops (marketing year averages), crop yields and crop acreages.

Crop categories used by the TWDB differ from those used in IMPLAN datasets. To maintain consistency, sales and other statistics are reported using IMPLAN crop classifications. Table 1 shows the TWDB crops included in corresponding IMPLAN sectors, and Table 2 summarizes acreage and estimated annual water use for each crop classification (five-year average from 2003-2007). As shown in Table 2, the overwhelming majority of irrigation in Region H is for rice. Thus, in our analysis we disregard other crop types. Table 3 displays average (2003-2007) gross revenues per acre for rice production applied in the analysis.

IMPLAN Category	TWDB Category
Oilseeds	Soybeans and "other oil crops"
Grains	Grain sorghum, corn, wheat and "other grain crops"
Vegetable and melons	"Vegetables" and potatoes
Tree nuts	Pecans
Fruits	Citrus, vineyard and other orchard
Cotton	Cotton
Sugarcane and sugar beets	Sugarcane and sugar beets
All "other" crops	"Forage crops", peanuts, alfalfa, hay and pasture, rice and "all other crops"

Table 2: Summary of Irrigated Crop Acreage and Water Demand for the Region H Regional Water Planning Area (average 2003-2007)				
Sector	Acres (1000s)	Distribution of Acres	Water Use (1000s of AF)	Distribution of Water Use
Oilseeds	1.0	2%	<1	<1%
Grains	<1	<1%	<1	<1%
Vegetable and melons	<1	<1%	<1	<1%
Tree nuts	<1	<1%	<1	<1%
Fruits	<1	<1%	<1	<1%
Cotton	0	0%	0	0%
Sugarcane and sugar beets	0	0%	0	0%
Rice	53	97%	291	99%
Total	55	100%	292	100%

Source: Water demand figures are a 5- year average (2003-2007) of the TWDB's annual Irrigation Water Use Estimates. Statistics for irrigated crop acreage are based upon annual survey data collected by the TWDB and the Farm Service Agency. Values do not include acreage or water use for the TWDB categories classified by the Farm Services Agency as "failed acres," "golf course" or "waste water."

Table 3: Average Gross Sales Revenues per Acre for Irrigated Crops for the Region H Regional Water Planning Area (2003-2007)				
IMPLAN Sector	Gross Revenues per Acre	Crops Included in Estimates		
All Other Crops	\$570	Based on five-year (2003-2007) average weighted by acreage for "rice."		
*Figures are rounded. Source: Based on data from the Texas Agricultural Statistics Service, Texas Water Development Board, and Texas A&M University.				

The following steps outline the overall process used to estimate direct impacts to irrigated agriculture:

- Distribute shortages across predominant crop types in the region. Again, unmet water needs
 were distributed equally across crop sectors that constitute one percent or more of irrigated
 acreage.
- 2. Estimate associated reductions in output for affected crop sectors. Output reductions are based on elasticities discussed previously and on estimated values per acre for different crops. Values per acre stem from the same data used to estimate output for the year 2006 baseline. Using multipliers, we then generate estimates of forgone income, jobs, and tax revenues based on reductions in gross sales and final demand.
- 3. Reduce sales revenues for forward processers in proportion to lost rice production. As discussed in Section 1.1, input output models capture indirect losses to suppliers and other businesses that depend upon rice farming, but only those providing inputs to rice production. Multipliers do not capture potential impacts to forward processors, in this case rice mills, which add considerable value to the product and hence income and jobs to the state. For example, Texas rice farming directly generates about \$60 to \$80 in gross state product. Once the rice harvested it is sold to rice mills that process and resell the crop. This added value generates an additional \$60 to \$80 million in direct gross state product. Impacts measured in the study capture this additional value added.

Livestock

The approach used for the livestock sector is basically the same as that used for crop production. As is the case with crops, livestock categorizations used by the TWDB differ from those used in IMPLAN datasets, and TWDB groupings were assigned to a given IMPLAN sector (Table 4). Then we:

1) Distribute projected water needs equally among predominant livestock sectors and estimate lost output: As is the case with irrigation, shortages are assumed to affect all livestock sectors equally; however, the category of "other" is not included given its small size. If water needs were

small relative to total demands, we assume that producers would haul in water by truck to fill stock tanks. The cost per acre-foot (\$24,000) is based on 2008 rates charged by various water haulers in Texas, and assumes that the average truck load is 6,500 gallons at a hauling distance of 60 miles.

3) Estimate reduced output in forward processors for livestock sectors. Reductions in output for livestock sectors are assumed to have a proportional impact on forward processors in the region such as meat packers. In other words, if the cows were gone, meat-packing plants or fluid milk manufacturers) would likely have little to process. This is not an unreasonable premise. Since the 1950s, there has been a major trend towards specialized cattle feedlots, which in turn has decentralized cattle purchasing from livestock terminal markets to direct sales between producers and slaughterhouses. Today, the meat packing industry often operates large processing facilities near high concentrations of feedlots to increase capacity utilization. As a result, packers are heavily dependent upon nearby feedlots. For example, a recent study by the USDA shows that on average meat packers obtain 64 percent of cattle from within 75 miles of their plant, 82 percent from within 150 miles and 92 percent from within 250 miles.

Table 4: Description of Livestock Sectors			
IMPLAN Category TWDB Category			
Cattle ranching	Cattle, cow calf, feedlots and dairies		
Poultry and egg production	Poultry production.		
Other livestock	Livestock other than cattle and poultry (i.e., horses, goats, sheep, hogs)		
Milk manufacturing	Fluid milk manufacturing, cheese manufacturing, ice cream manufacturing etc.		
Meat packing	Meat processing present in the region from slaughter to final processing		

1.1.3 Impacts to Municipal Water User Groups

Disaggregation of Municipal Water Demands

Estimating the economic impacts for the municipal water user groups is complicated for a number of reasons. For one, municipal use comprises a range of consumers including commercial businesses, institutions such as schools and government and households. However, reported water needs are not distributed among different municipal water users. In other words, how much of a municipal need is commercial and how much is residential (domestic)?

⁵ Ferreira, W.N. *"Analysis of the Meat Processing Industry in the United States."* Clemson University Extension Economics Report ER211, January 2003.

⁶ Ward, C.E. "Summary of Results from USDA's Meatpacking Concentration Study." Oklahoma Cooperative Extension Service, OSU Extension Facts WF-562.

The amount of commercial water use as a percentage of total municipal demand was estimated based on "GED" coefficients (gallons per employee per day) published in secondary sources. For example, if year 2006 baseline data for a given economic sector (e.g., amusement and recreation services) shows employment at 30 jobs and the GED coefficient is 200, then average daily water use by that sector is (30 x 200 = 6,000 gallons) or 6.7 acre-feet per year. Water not attributed to commercial use is considered domestic, which includes single and multi-family residential consumption, institutional uses and all use designated as "county-other." Based on our analysis, commercial water use is about 5 to 35 percent of municipal demand. Less populated rural counties occupy the lower end of the spectrum, while larger metropolitan counties are at the higher end.

After determining the distribution of domestic versus commercial water use, we developed methods for estimating impacts to the two groups.

Domestic Water Uses

Input output models are not well suited for measuring impacts of shortages for domestic water uses, which make up the majority of the municipal water use category. To estimate impacts associated with domestic water uses, municipal water demand and needs are subdivided into residential, and commercial and institutional use. Shortages associated with residential water uses are valued by estimating proxy demand functions for different water user groups allowing us to estimate the marginal value of water, which would vary depending upon the level of water shortages. The more severe the water shortage, the more costly it becomes. For instance, a 2 acre-foot shortage for a group of households that use 10 acre-feet per year would not be as severe as a shortage that amounted to 8 acre-feet. In the case of a 2 acre-foot shortage, households would probably have to eliminate some or all outdoor water use, which could have implicit and explicit economic costs including losses to the horticultural and landscaping industry. In the case of an 8 acre-foot shortage, people would have to forgo all outdoor water use and most indoor water consumption. Economic impacts would be much higher in the latter case because people, and would be forced to find emergency alternatives assuming alternatives were available.

To estimate the value of domestic water uses, TWDB staff developed marginal loss functions based on constant elasticity demand curves. This is a standard and well-established method used by economists to value resources such as water that have an explicit monetary cost.

A constant price elasticity of demand is estimated using a standard equation:

$$w = kc^{(-\epsilon)}$$

where:

 w is equal to average monthly residential water use for a given water user group measured in thousands of gallons;

k is a constant intercept;

⁷ Sources for GED coefficients include: Gleick, P.H., Haasz, D., Henges-Jeck, C., Srinivasan, V., Wolff, G. Cushing, K.K., and Mann, A. - c is the average cost of water per 1,000 gallons; and
- ϵ is the price elasticity of demand.

Price elasticities (-0.30 for indoor water use and -0.50 for outdoor use) are based on a study by Bell et al. that surveyed 1,400 water utilities in Texas that serve at least 1,000 people to estimate demand elasticity for several variables including price, income, weather etc. Costs of water and average use per month per household are based on data from the Texas Municipal League's annual water and wastewater rate surveys - specifically average monthly household expenditures on water and wastewater in different communities across the state. After examining variance in costs and usage, three different categories of water user groups based on population (population less than 5,000, cities with populations ranging from 5,000 to 99,999 and cities with populations exceeding 100,000) were selected to serve as proxy values for municipal water groups that meet the criteria (Table 5).

Table 5: Water Use and Costs Parameters Used to Estimated Water Demand Function	ıs
(average monthly costs per acre-foot for delivered water and average monthly use per hou	sehold)

Community Population	Water	Wastewater	Total Monthly Cost	Avg. Monthly Use (gallons)
Less than or equal to 5,000	\$1,335	\$1,228	\$2,563	6,204
5,000 to 100,000	\$1,047	\$1,162	\$2,209	7,950
Great than or equal to 100,000	\$718	\$457	\$1,190	8,409

Source: Based on annual water and wastewater rate surveys published by the Texas Municipal League.

As an example, Table 6 shows the economic impact per acre-foot of domestic water needs for municipal water user groups with population exceeding 100,000 people. There are several important assumptions incorporated in the calculations:

- 1) Reported values are net of the variable costs of treatment and distribution such as expenses for chemicals and electricity since using less water involves some savings to consumers and utilities alike; and for outdoor uses we do not include any value for wastewater.
- 2) Outdoor and "non-essential" water uses would be eliminated before indoor water consumption was affected, which is logical because most water utilities in Texas have drought contingency plans that generally specify curtailment or elimination of outdoor water use during droughts. ¹⁰ Determining how much water is used for outdoor purposes

⁸ Bell, D.R. and Griffin, R.C. "Community Water Demand in Texas as a Century is Turned." Research contract report prepared for the Texas Water Development Board. May 2006.

⁹ Ideally, one would want to estimate demand functions for each individual utility in the state. However, this would require an enormous amount of time and resources. For planning purposes, we believe the values generated from aggregate data are more than sufficient.

¹⁰ In Texas, state law requires retail and wholesale water providers to prepare and submit plans to the Texas Commission on Environmental Quality (TCEQ). Plans must specify demand management measures for use during drought including curtailment of

is based on several secondary sources. The first is a major study sponsored by the American Water Works Association, which surveyed cities in states including Colorado, Oregon, Washington, California, Florida and Arizona. On average across all cities surveyed 58 percent of single family residential water use was for outdoor activities. In cities with climates comparable to large metropolitan areas of Texas, the average was 40 percent. Earlier findings of the U.S. Water Resources Council showed a national average of 33 percent. Similarly, the United States Environmental Protection Agency (USEPA) estimated that landscape watering accounts for 32 percent of total residential and commercial water use on annual basis. A study conducted for the California Urban Water Agencies (CUWA) calculated average annual values ranging from 25 to 35 percent. Unfortunately, there does not appear to be any comprehensive research that has estimated non-agricultural outdoor water use in Texas. As an approximation, an average annual value of 30 percent based on the above references was selected to serve as a rough estimate in this study.

3) As shortages approach 100 percent values become immense and theoretically infinite at 100 percent because at that point death would result, and willingness to pay for water is immeasurable. Thus, as shortages approach 80 percent of monthly consumption, we assume that households and non-water intensive commercial businesses (those that use water only for drinking and sanitation would have water delivered by tanker truck or commercial water delivery companies. Based on reports from water companies throughout the state, we estimate that the cost of trucking in water is around \$21,000 to \$27,000 per acre-feet assuming a hauling distance of between 20 to 60 miles. This is not an unreasonable assumption. The practice was widespread during the 1950s drought and recently during droughts in this decade. For example, in 2000 at the heels of three consecutive drought years Electra - a small town in North Texas - was down to its last 45 days worth of reservoir water when rain replenished the lake, and the city was able to refurbish old wells to provide supplemental groundwater. At the time, residents were forced to limit water use to 1,000 gallons per person per month - less than half of what most people use - and many were having water delivered to their homes by private contractors. ¹⁴ In 2003 citizens of Ballinger, Texas, were also faced with a dwindling water supply due to prolonged drought. After three years of drought, Lake Ballinger, which supplies water to more than 4,300 residents in Ballinger and to 600 residents in nearby Rowena, was almost dry. Each day, people lined up to get water from a well in nearby City Park. Trucks hauling trailers outfitted with large plastic and metal tanks hauled water to and from City Park to Ballinger. 15

[&]quot;non-essential water uses." Non-essential uses include, but are not limited to, landscape irrigation and water for swimming pools or fountains. For further information see the Texas Environmental Quality Code §288.20.

Infinite

(\$24,000)

0

100%

0

Infinite (\$0.07)

^a The first 30 percent of needs are assumed to be restrictions of outdoor water use; when needs reach 30 percent of total demands all outdoor water uses would be restricted. Needs greater than 30 percent include indoor use.

^b As shortages approach 100 percent the value approaches infinity assuming there are not alternatives available; however, we assume that communities would begin to have water delivered by tanker truck at an estimated cost of \$24,000 per acre-foot when shortages breached 85 percent.

Commercial Businesses

Effects of water shortages on commercial sectors were estimated in a fashion similar to other business sectors meaning that water shortages would affect the ability of these businesses to operate. This is particularly true for "water intensive" commercial sectors that are need large amounts of water (in addition to potable and sanitary water) to provide their services. These include:

- car-washes,
- laundry and cleaning facilities,
- sports and recreation clubs and facilities including race tracks,
- amusement and recreation services,
- hospitals and medical facilities,
- hotels and lodging places, and
- eating and drinking establishments.

A key assumption is that commercial operations would not be affected until water shortages were at least 50 percent of total municipal demand. In other words, we assume that residential water consumers would reduce water use including all non-essential uses before businesses were affected.

An example will illustrate the breakdown of municipal water needs and the overall approach to estimating impacts of municipal needs. Assume City A experiences an unexpected shortage of 50 acrefeet per year when their demands are 200 acre-feet per year. Thus, shortages are only 25 percent of total municipal use and residents of City A could eliminate needs by restricting landscape irrigation. City B, on the other hand, has a deficit of 150 acre-feet in 2020 and a projected demand of 200 acre-feet. Thus, total shortages are 75 percent of total demand. Emergency outdoor and some indoor conservation measures could eliminate 50 acre-feet of projected needs, yet 50 acre-feet would still remain. To eliminate" the remaining 50 acre-feet water intensive commercial businesses would have to curtail operations or shut down completely.

Three other areas were considered when analyzing municipal water shortages: 1) lost revenues to water utilities, 2) losses to the horticultural and landscaping industries stemming for reduction in water available for landscape irrigation, and 3) lost revenues and related economic impacts associated with reduced water related recreation.

Water Utility Revenues

Estimating lost water utility revenues was straightforward. We relied on annual data from the "Water and Wastewater Rate Survey" published annually by the Texas Municipal League to calculate an average value per acre-foot for water and sewer. For water revenues, average retail water and sewer rates multiplied by total water needs served as a proxy. For lost wastewater, total unmet needs were adjusted for return flow factor of 0.60 and multiplied by average sewer rates for the region. Needs reported as "county-other" were excluded under the presumption that these consist primarily of self-supplied water uses. In addition, 15 percent of water demand and needs are considered non-billed or "unaccountable" water that comprises things such as leakages and water for municipal government functions (e.g., fire departments). Lost tax receipts are based on current rates for the "miscellaneous gross receipts tax, "which the state collects from utilities located in most incorporated cities or towns in Texas. We do not include lost water utility revenues when aggregating impacts of municipal water shortages to regional and state levels to prevent double counting.

Horticultural and Landscaping Industry

The horticultural and landscaping industry, also referred to as the "green Industry," consists of businesses that produce, distribute and provide services associated with ornamental plants, landscape and garden supplies and equipment. Horticultural industries often face big losses during drought. For example, the recent drought in the Southeast affecting the Carolinas and Georgia horticultural and landscaping businesses had a harsh year. Plant sales were down, plant mortality increased, and watering costs increased. Many businesses were forced to close locations, lay off employees, and even file for bankruptcy. University of Georgia economists put statewide losses for the industry at around \$3.2 billion during the 3-year drought that ended in 2008. Municipal restrictions on outdoor watering play a significant role. During drought, water restrictions coupled with persistent heat has a psychological effect on homeowners that reduces demands for landscaping products and services. Simply put, people were afraid to spend any money on new plants and landscaping.

In Texas, there do not appear to be readily available studies that analyze the economic effects of water shortages on the industry. However, authors of this report believe negative impacts do and would result in restricting landscape irrigation to municipal water consumers. The difficulty in measuring them is two-fold. First, as noted above, data and research for these types of impacts that focus on Texas are limited; and second, economic data provided by IMPLAN do not disaggregate different sectors of the green industry to a level that would allow for meaningful and defensible analysis. ¹⁷
Recreational Impacts

Recreational businesses often suffer when water levels and flows in rivers, springs and reservoirs fall significantly during drought. During droughts, many boat docks and lake beaches are forced to close, leading to big losses for lakeside business owners and local communities. Communities adjacent to popular river and stream destinations such as Comal Springs and the Guadalupe River also see their business plummet when springs and rivers dry up. Although there are many examples of businesses that have suffered due to drought, dollar figures for drought-related losses to the recreation and tourism industry are not readily available, and very difficult to measure without extensive local surveys. Thus, while they are important, economic impacts are not measured in this study.

Table 7 summarizes impacts of municipal water shortages at differing levels of magnitude, and shows the ranges of economic costs or losses per acre-foot of shortage for each level.

¹⁷ Economic impact analyses prepared by the TWDB for 2006 regional water plans did include estimates for the horticultural industry. However, year 2000 and prior IMPLAN data were disaggregated to a finer level. In the current dataset (2006), the sector previously listed as "Landscaping and Horticultural Services" (IMPLAN Sector 27) is aggregated into "Services to Buildings and Dwellings" (IMPLAN Sector 458).

1.1.4 Industrial Water User Groups

Manufacturing

Impacts to manufacturing were estimated by distributing water shortages among industrial sectors at the county level. For example, if a planning group estimates that during a drought of record water supplies in County A would only meet 50 percent of total annual demands for manufactures in the county, we reduced output for each sector by 50 percent. Since projected manufacturing demands are based on TWDB Water Uses Survey data for each county, we only include IMPLAN sectors represented in the TWBD survey database. Some sectors in IMPLAN databases are not part of the TWDB database given that they use relatively small amounts of water - primarily for on-site sanitation and potable purposes. To maintain consistency between IMPLAN and TWDB databases, Standard Industrial Classification (SIC) codes both databases were cross referenced in county with shortages. Non-matches were excluded when calculating direct impacts.

Mining

The process of mining is very similar to that of manufacturing. We assume that within a given county, shortages would apply equally to relevant mining sectors, and IMPLAN sectors are cross referenced with TWDB data to ensure consistency.

In Texas, oil and gas extraction and sand and gravel (aggregates) operations are the primary mining industries that rely on large volumes of water. For sand and gravel, estimated output reductions are straightforward; however, oil and gas is more complicated for a number of reasons. IMPLAN does not necessarily report the physical extraction of minerals by geographic local, but rather the sales revenues reported by a particular corporation.

For example, at the state level revenues for IMPLAN sector 19 (oil and gas extraction) and sector 27 (drilling oil and gas wells) totals \$257 billion. Of this, nearly \$85 billion is attributed to Harris County. However, only a very small fraction (less than one percent) of actual production takes place in the county. To measure actual potential losses in well head capacity due to water shortages, we relied on county level production data from the Texas Railroad Commission (TRC) and average well-head market prices for crude and gas to estimate lost revenues in a given county. After which, we used to IMPLAN ratios to estimate resultant losses in income and employment.

Other considerations with respect to mining include:

- 1) Petroleum and gas extraction industry only uses water in significant amounts for secondary recovery. Known in the industry as enhanced or water flood extraction, secondary recovery involves pumping water down injection wells to increase underground pressure thereby pushing oil or gas into other wells. IMPLAN output numbers do not distinguish between secondary and non-secondary recovery. To account for the discrepancy, county-level TRC data that show the proportion of barrels produced using secondary methods were used to adjust IMPLAN data to reflect only the portion of sales attributed to secondary recovery.
- 2) A substantial portion of output from mining operations goes directly to businesses that are classified as manufacturing in our schema. Thus, multipliers measuring backward linkages for a given manufacturer might include impacts to a supplying mining operation. Care was taken not to double count in such situations if both a mining operation and a manufacturer were reported as having water shortages.

Steam-electric

At minimum without adequate cooling water, power plants cannot safely operate. As water availability falls below projected demands, water levels in lakes and rivers that provide cooling water would also decline. Low water levels could affect raw water intakes and outfalls at electrical generating units in several ways. For one, power plants are regulated by thermal emission guidelines that specify the maximum amount of heat that can go back into a river or lake via discharged cooling water. Low water levels could result in permit compliance issues due to reduced dilution and dispersion of heat and subsequent impacts on aquatic biota near outfalls. However, the primary concern would be a loss of head (i.e., pressure) over intake structures that would decrease flows through intake tunnels. This would affect safety related pumps, increase operating costs and/or result in sustained shut-downs. Assuming plants did shutdown, they would not be able to generate electricity.

¹⁸ Section 316 (b) of the Clean Water Act requires that thermal wastewater discharges do not harm fish and other wildlife.

Among all water use categories steam-electric is unique and cautions are needed when applying methods used in this study. Measured changes to an economy using input-output models stem directly from changes in sales revenues. In the case of water shortages, one assumes that businesses will suffer lost output if process water is in short supply. For power generation facilities this is true as well. However, the electric services sector in IMPLAN represents a corporate entity that may own and operate several electrical generating units in a given region. If one unit became inoperable due to water shortages, plants in other areas or generation facilities that do not rely heavily on water such as gas powered turbines might be able to compensate for lost generating capacity. Utilities could also offset lost production via purchases on the spot market. Thus, depending upon the severity of the shortages and conditions at a given electrical generating unit, energy supplies for local and regional communities could be maintained. But in general, without enough cooling water, utilities would have to throttle back plant operations, forcing them to buy or generate more costly power to meet customer demands.

Measuring impacts end users of electricity is not part of this study as it would require extensive local and regional level analysis of energy production and demand. To maintain consistency with other water user groups, impacts of steam-electric water shortages are measured in terms of lost revenues (and hence income) and jobs associated with shutting down electrical generating units.

1.2 Social Impacts of Water Shortages

As the name implies, the effects of water shortages can be social or economic. Distinctions between the two are both semantic and analytical in nature – more so analytic in the sense that social impacts are harder to quantify. Nevertheless, social effects associated with drought and water shortages are closely tied to economic impacts. For example, they might include:

- demographic effects such as changes in population,
- disruptions in institutional settings including activity in schools and government,
- conflicts between water users such as farmers and urban consumers,
- health-related low-flow problems (e.g., cross-connection contamination, diminished sewage flows, increased pollutant concentrations),
- mental and physical stress (e.g., anxiety, depression, domestic violence),
- public safety issues from forest and range fires and reduced fire fighting capability,
- increased disease caused by wildlife concentrations,
- loss of aesthetic and property values, and
- reduced recreational opportunities.²⁰

¹⁹ Today, most utilities participate in large interstate "power pools" and can buy or sell electricity "on the grid" from other utilities or power marketers. Thus, assuming power was available to buy, and assuming that no contractual or physical limitations were in place such as transmission constraints; utilities could offset lost power that resulted from waters shortages with purchases via the power

²⁰ Based on information from the website of the National Drought Mitigation Center at the University of Nebraska Lincoln. Available online at: http://www.drought.unl.edu/risk/impacts.htm. See also, Vanclay, F. "Social Impact Assessment." in Petts, J. (ed) International Handbook of Environmental Impact Assessment. 1999.

Social impacts measured in this study focus strictly on demographic effects including changes in population and school enrollment. Methods are based on demographic projection models developed by the Texas State Data Center and used by the TWDB for state and regional water planning. Basically, the social impact model uses results from the economic component of the study and assesses how changes in labor demand would affect migration patterns in a region. Declines in labor demand as measured using adjusted IMPLAN data are assumed to affect net economic migration in a given regional water planning area. Employment losses are adjusted to reflect the notion that some people would not relocate but would seek employment in the region and/or public assistance and wait for conditions to improve. Changes in school enrollment are simply the proportion of lost population between the ages of 5 and 17.

2. Results

Section 2 presents the results of the analysis at the regional level. Included are baseline economic data for each water use category, and estimated economics impacts of water shortages for water user groups with reported deficits. According to the 2011 *Region H Regional Water Plan*, during severe drought irrigation, municipal, manufacturing, mining and steam-electric water user groups would experience water shortages in the absence of new water management strategies.

2.1 Overview of Regional Economy

On an annual basis, the Region H economy generates slightly more than \$373 billion in gross state product for Texas (\$342 billion in income and \$31 billion in state and local business taxes) and supports 3,386,000 jobs (Table 8). Generating nearly \$79 billion worth of income per year manufacturing (particularly petrochemical refining) is the primary base economic sector in the region and state. ²¹ Municipal sectors also generate substantial amounts of activity, nearly \$212 billion per year in gross state product, and are major employers in the region. While municipal sectors are the largest employer and source of wealth, many businesses that make up the municipal category such as restaurants and retail stores are non-basic industries meaning they exist to provide services to people who work would in base industries such as manufacturing, agriculture and mining. In other words, without base industries such agriculture, many municipal jobs in the region would not exist.

-

²¹ Base industries are those that supply markets outside of a region. These industries are crucial to the local economy and are called the economic base of a region. Appendix A shows how IMPLAN's 529 sectors were allocated to water use category, and shows economic data for each sector.

Table 8: The Region H Economy by Water User Group (\$millions) ^a						
Water Use Category	Total sales	Intermediate sales	Final sales	Jobs	Income	Business taxes
Irrigation b	\$401.01	\$46.25	\$354.76	966	\$69.22	\$3.73
Livestock	\$1,812.22	\$772.84	\$1,039.38	15,033	\$210.98	\$17.29
Manufacturing	\$377,287.75	\$120,954.26	\$256,333.49	493,526	\$75,600.29	\$2,527.00
Mining	\$100,671.55	\$69,837.10	\$30,834.44	124,166	\$56,104.32	\$6,280.56
Steam-electric	\$25,548.42	\$7,187.34	\$18,361.09	12,412	\$17,800.89	\$2,967.22
Municipal	\$333,733.23	\$116,264.88	\$217,468.36	2,740,308	\$192,557.01	\$19,069.36
Regional total	\$839,461.58	\$315,061.19	\$524,048.55	3,386,006	\$342,302.00	\$30,862.53

^a Appendix 1 displays data for individual IMPLAN sectors that make up each water use category. Based on data from the Texas Water Development Board, and year 2006 data from the Minnesota IMPLAN Group, Inc.

2.2 Impacts of Agricultural Water Shortages

According to the 2011 Region H Regional Water Plan, during severe drought the counties of Brazoria, Chambers, Galveston, Liberty, and Waller would experiences shortages of irrigation water without new management strategies. In 2010, shortages range from about 15 to 90 percent of annual irrigation demands. Shortages of these magnitudes would reduce gross state product (income plus state and local business taxes) by an estimated \$68 million in 2010 and \$61 million in 2060 with potential job losses ranging from 849 to 730. These figures include impacts to rice mills.

Table 9: Economic Impacts of Water Shortages for Irrigation Water User Groups (\$millions)				
Decade	Lost income from reduced rice production and milling activity ^a	Lost state and local tax revenues from reduced rice production and milling activity	Lost jobs from rice production and milling activity	
2010	\$68.19	\$7.89	849	
2020	\$62.37	\$7.22	769	
2030	\$59.88	\$6.93	739	
2040	\$58.65	\$6.79	722	
2050	\$59.82	\$6.92	726	
2060	\$61.15	\$7.08	730	

^{*}Changes to Income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

^b Irrigation includes activity for both rice farms and rice mills.

2.3 Impacts of Municipal Water Shortages

Water shortages are projected to occur in a significant number of communities in Region H. At the regional level, the estimated economic value of domestic water shortages totals \$97 million in 2010 and \$4,798 million in 2060 (Table 10). Municipal shortages would also restrict the operation of many commercial businesses reducing gross state product by an estimated \$30 million in 2010 and \$2,738 million in 2060.

	Table 10: Economic Impacts of Water Shortages for Municipal Water User Groups (\$millions)				
Decade	Monetary value of domestic water shortages	Lost income from reduced commercial business activity*	Lost state and local taxes from reduced commercial business activity	Lost jobs from reduced commercial business activity	Lost water utility revenues
2010	\$96.95	\$26.40	\$3.57	813	\$78.89
2020	\$312.58	\$364.24	\$40.51	8,583	\$349.72
2030	\$847.63	\$1,297.19	\$143.13	30,419	\$535.20
2040	\$1,581.98	\$1,439.98	\$162.99	34,850	\$618.95
2050	\$2,948.37	\$2,089.60	\$226.17	48,039	\$726.54
2060	\$4,810.50	\$2,520.56	\$272.38	57,821	\$905.55

^{*}Changes to Income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

2.4 Impacts of Manufacturing Water Shortages

Manufacturing water shortages in the region are projected to occur in Brazoria, Chambers, Fort Bend, Harris, Leon, Liberty, Madison, Montgomery, San Jacinto, Walker, and Waller. The Region H planning group estimates that these manufacturers would be short nearly 75,000 acre-feet of water in 2010 and 253,000 acre-feet in 2060. Shortages of these magnitudes would reduce gross state product (income plus taxes) by an estimated \$2,939 million in 2010 and \$12,199 million in 2060 (Table 11).

Table 11: Economic Impacts of Water Shortages for Manufacturing Water User Groups (\$millions)				
Decade	Lost income due to reduced manufacturing output	Lost state and local business tax revenues due to reduced manufacturing output	C Lost jobs due to reduced manufacturing output	
2010	\$2,732.37	\$263.52	16,765	
2020	\$4,049.18	\$388.78	25,236	
2030	\$7,425.93	\$701.18	46,038	
2040	\$8,772.39	\$831.23	54,765	
2050	\$9,992.81	\$946.84	62,577	
2060	\$11,240.68	\$1,076.53	71,341	

^{*}Changes to Income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

2.5 Impacts of Mining Water Shortages

Ming water shortages in the region are projected to occur in Harris, Liberty, Montgomery and Polk counties, and would primarily affect the oil and gas and aggregates operations. In total, shortages would reduce gross state product by \$35 million in 2010 and \$233 million in 2060 (Table 12).

Table 12: Economic Impacts of Water Shortages for Mining Water User Groups (\$millions)				
Decade	Lost income due to reduced mining output	Lost state and local business tax revenues due to reduced mining output	Lost jobs due to reduced mining output	
2010	\$35.39	\$3.42	619	
2020	\$61.78	\$5.94	1,048	
2030	\$84.50	\$8.15	1,390	
2040	\$101.86	\$9.79	1,659	
2050	\$204.68	\$19.78	3,472	
2060	\$233.81	\$22.46	3,916	

^{*}Changes to Income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

2.6 Impacts of Steam-electric Water Shortages

Water shortages for steam-electric water user groups are projected to occur in Fort Bend, Galveston, Harris, Liberty, and Montgomery counties, and would reduce gross state product by \$380 million dollars in 2010, and \$5,238 million 2060 (Table 13).

	Table 13: Economic Impacts of W	ater Shortages for Steam-electric Water	· User Groups (\$millions)
Decade	Lost income due to reduced electrical generation	Lost state and local business tax revenues due to reduced electrical generation	Lost jobs due to reduced electrical generation
2010	\$332.33	\$47.70	1,130
2020	\$650.93	\$93.43	2,213
2030	\$1,144.78	\$164.32	3,892
2040	\$2,537.55	\$364.23	8,626
2050	\$3,411.75	\$489.70	11,598
2060	\$4,580.79	\$657.50	15,572

^{*}Changes to Income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to Gross Domestic Product measured at the state rather than national level.

2.7 Social Impacts of Water Shortages

As discussed previously, estimated social impacts focus on changes in population and school enrollment. In 2010, estimated population losses total 24,433 with corresponding reductions in school enrollment of 6,891 students (Table 14). In 2060, population in the region would decline by 175,389 people and school enrollment would fall by 32,522 students.

Table 14: Social Impacts of Water Shortages (2010-2060)							
Year	Population Losses	Declines in School Enrollment					
2010	24,433	6,891					
2020	45,514	12,913					
2030	99,071	26,242					
2040	122,686	22,674					
2050	152,028	28,078					
2060	175,839	32,522					

2.8 Distribution of Impacts by Major River Basin

Administrative rules require that impacts are presented by both planning region and major river basin. To meet rule requirements, impacts were allocated among basins based on the distribution of water shortages in relevant basins. For example, if 50 percent of water shortages in River Basin A and 50 percent occur in River Basin B, then impacts were split equally among the two basins. Table 15 displays the results.

Mr. Kelley Holcomb Chairman, East Texas Regional Water Planning Group c/o General Manager, Angelina & Neches River Authority P.O. Box 387 Lufkin, Texas 75902-0387

Re: Socioeconomic Impact Analysis of Not Meeting Water Needs for the 2011 East Texas Regional Water Plan

Dear Chairman Holcomb:

We have received your request for technical assistance to complete the socioeconomic impact analysis of not meeting water needs. In response, enclosed is a report that describes our methodology and presents the results. Section 1 provides an overview of the methodology, and Section 2 presents results for at the regional level, and Appendix 2 show results for individual water user groups.

If you have any questions or comments, please feel free to contact me at (512) 463-7928 or by email at stuart.norvell@twdb.state.tx.us.

Sincerely,

Stuart D. Norvell

Manager, Water Planning Research and Analysis

Water Resources Planning Division

SN/ao

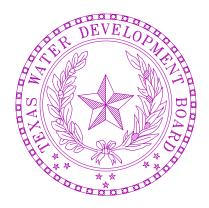

Enclosure

c. Temple Mckinnon, TWDB S. Doug Shaw, TWDB

Our Mission

To provide leadership, planning, financial assistance, information, and education for the conservation and responsible development of water for Texas.

Socioeconomic Impacts of Projected Water Shortages for the East Texas Regional Water Planning Area (Region I)

Prepared in Support of the 2011 East Texas Regional Water Plan

Stuart D. Norvell, Managing Economist Water Resources Planning Division Texas Water Development Board Austin, Texas

S. Doug Shaw, Agricultural Economist Water Resources Planning Division Texas Water Development Board Austin, Texas

Introduction

Water shortages during drought would likely curtail or eliminate economic activity in business and industries reliant on water. For example, without water farmers cannot irrigate; refineries cannot produce gasoline, and paper mills cannot make paper. Unreliable water supplies would not only have an immediate and real impact on existing businesses and industry, but they could also adversely affect economic development in Texas. From a social perspective, water supply reliability is critical as well. Shortages would disrupt activity in homes, schools and government and could adversely affect public health and safety. For all of the above reasons, it is important to analyze and understand how restricted water supplies during drought could affect communities throughout the state.

Administrative rules require that regional water planning groups evaluate the impacts of not meeting water needs as part of the regional water planning process, and rules direct TWDB staff to provide technical assistance: "The executive administrator shall provide available technical assistance to the regional water planning groups, upon request, on water supply and demand analysis, including methods to evaluate the social and economic impacts of not meeting needs" [(§357.7 (4)(A)]. Staff of the TWDB's Water Resources Planning Division designed and conducted this report in support of the Northeast Texas Regional Water Planning Group (Region I).

This document summarizes the results of our analysis and discusses the methodology used to generate the results. Section 1 outlines the overall methodology and discusses approaches and assumptions specific to each water use category (i.e., irrigation, livestock, mining, steam-electric, municipal and manufacturing). Section 2 presents the results for each category where shortages are reported at the regional planning area level and river basin level. Results for individual water user groups are not presented, but are available upon request.

1. Methodology

Section 1 provides a general overview of how economic and social impacts were measured. In addition, it summarizes important clarifications, assumptions and limitations of the study.

1.1 Economic Impacts of Water Shortages

1.1.1 General Approach

Economic analysis as it relates to water resources planning generally falls into two broad areas. Supply side analysis focuses on costs and alternatives of developing new water supplies or implementing programs that provide additional water from current supplies. Demand side analysis concentrates on impacts or benefits of providing water to people, businesses and the environment. Analysis in this report focuses strictly on demand side impacts. When analyzing the economic impacts of water shortages as defined in Texas water planning, three potential scenarios are possible:

Scenario 1 involves situations where there are physical shortages of raw surface or groundwater due to drought of record conditions. For example, City A relies on a reservoir with average conservation storage of 500 acre-feet per year and a firm yield of 100 acre feet. In 2010, the city uses about 50 acre-feet per year, but by 2030 their demands are expected to increase to 200 acre-feet. Thus, in 2030 the reservoir would not have enough water to meet the city's demands, and people would experience a shortage of 100 acre-feet assuming drought of record conditions. Under normal or average climatic conditions, the reservoir would likely be able to provide reliable water supplies well beyond 2030.

- 2) Scenario 2 is a situation where despite drought of record conditions, water supply sources can meet existing use requirements; however, limitations in water infrastructure would preclude future water user groups from accessing these water supplies. For example, City B relies on a river that can provide 500 acre-feet per year during drought of record conditions and other constraints as dictated by planning assumptions. In 2010, the city is expected to use an estimated 100 acre-feet per year and by 2060 it would require no more than 400 acre-feet. But the intake and pipeline that currently transfers water from the river to the city's treatment plant has a capacity of only 200 acre-feet of water per year. Thus, the city's water supplies are adequate even under the most restrictive planning assumptions, but their conveyance system is too small. This implies that at some point perhaps around 2030 infrastructure limitations would constrain future population growth and any associated economic activity or impacts.
- 3) Scenario 3 involves water user groups that rely primarily on aquifers that are being depleted. In this scenario, projected and in some cases existing demands may be unsustainable as groundwater levels decline. Areas that rely on the Ogallala aquifer are a good example. In some communities in the region, irrigated agriculture forms a major base of the regional economy. With less irrigation water from the Ogallala, population and economic activity in the region could decline significantly assuming there are no offsetting developments.

Assessing the social and economic effects of each of the above scenarios requires various levels and methods of analysis and would generate substantially different results for a number of reasons; the most important of which has to do with the time frame of each scenario. Scenario 1 falls into the general category of static analysis. This means that models would measure impacts for a small interval of time such as a drought. Scenarios 2 and 3, on the other hand imply a dynamic analysis meaning that models are concerned with changes over a much longer time period.

Since administrative rules specify that planning analysis be evaluated under drought of record conditions (a static and random event), socioeconomic impact analysis developed by the TWDB for the state water plan is based on assumptions of Scenario 1. Estimated impacts under scenario 1 are point estimates for years in which needs are reported (2010, 2020, 2030, 2040, 2050 and 2060). They are independent and distinct "what if" scenarios for a particular year and shortages are assumed to be temporary events resulting from drought of record conditions. Estimated impacts measure what would happen if water user groups experience water shortages for a period of one year.

The TWDB recognize that dynamic models may be more appropriate for some water user groups; however, combining approaches on a statewide basis poses several problems. For one, it would require a complex array of analyses and models, and might require developing supply and demand forecasts under "normal" climatic conditions as opposed to drought of record conditions. Equally important is the notion that combining the approaches would produce inconsistent results across regions resulting in a so-called "apples to oranges" comparison.

A variety tools are available to estimate economic impacts, but by far, the most widely used today are input-output models (IO models) combined with social accounting matrices (SAMs). Referred to as IO/SAM models, these tools formed the basis for estimating economic impacts for agriculture (irrigation and livestock water uses) and industry (manufacturing, mining, steam-electric and commercial business activity for municipal water uses).

Since the planning horizon extends through 2060, economic variables in the baseline are adjusted in accordance with projected changes in demographic and economic activity. Growth rates for municipal water use sectors (i.e., commercial, residential and institutional) are based on TWDB population forecasts. Future values for manufacturing, agriculture, and mining and steam-electric activity are based on the same underlying economic forecasts used to estimate future water use for each category.

The following steps outline the overall process.

Step 1: Generate IO/SAM Models and Develop Economic Baseline

IO/SAM models were estimated using propriety software known as IMPLAN PROTM (Impact for Planning Analysis). IMPLAN is a modeling system originally developed by the U.S. Forestry Service in the late 1970s. Today, the Minnesota IMPLAN Group (MIG Inc.) owns the copyright and distributes data and software. It is probably the most widely used economic impact model in existence. IMPLAN comes with databases containing the most recently available economic data from a variety of sources. Using IMPLAN software and data, transaction tables conceptually similar to the one discussed previously were estimated for each county in the region and for the region as a whole. Each transaction table contains 528 economic sectors and allows one to estimate a variety of economic statistics including:

- total sales total production measured by sales revenues;
- intermediate sales sales to other businesses and industries within a given region;
- final sales sales to end users in a region and exports out of a region;
- employment number of full and part-time jobs (annual average) required by a given industry including self-employment;
- regional income total payroll costs (wages and salaries plus benefits) paid by industries, corporate income, rental income and interest payments; and
- **business taxes** sales, excise, fees, licenses and other taxes paid during normal operation of an industry (does not include income taxes).

TWDB analysts developed an economic baseline containing each of the above variables using year 2000 data. Since the planning horizon extends through 2060, economic variables in the baseline were allowed to change in accordance with projected changes in demographic and economic activity. Growth rates for municipal water use sectors (i.e., commercial, residential and institutional) are based on TWDB population forecasts. Projections for manufacturing, agriculture, and mining and steam-electric activity are based on the same underlying economic forecasts used to estimate future water use for each category. Monetary impacts in future years are reported in constant year 2006 dollars.

It is important to stress that employment, income and business taxes are the most useful variables when comparing the relative contribution of an economic sector to a regional economy. Total sales as reported in IO/SAM models are less desirable and can be misleading because they include sales to other industries in the region for use in the production of other goods. For example, if a mill buys grain from local farmers and uses it to produce feed, sales of both the processed feed and raw corn are counted as "output" in an IO model. Thus, total sales double-count or overstate the true economic value of goods

¹The IMPLAN database consists of national level technology matrices based on benchmark input-output accounts generated by the U.S. Bureau of Economic Analysis and estimates of final demand, final payments, industry output and employment for various economic sectors. IMPLAN regional data (i.e. states, a counties or groups of counties within a state) are divided into two basic categories: 1) data on an industry basis including value-added, output and employment, and 2) data on a commodity basis including final demands and institutional sales. State-level data are balanced to national totals using a matrix ratio allocation system and county data are balanced to state totals.

and services produced in an economy. They are not consistent with commonly used measures of output such as Gross National Product (GNP), which counts only final sales.

Another important distinction relates to terminology. Throughout this report, the term sector refers to economic subdivisions used in the IMPLAN database and resultant input-output models (528 individual sectors based on Standard Industrial Classification Codes). In contrast, the phrase water use category refers to water user groups employed in state and regional water planning including irrigation, livestock, mining, municipal, manufacturing and steam electric. Each IMPLAN sector was assigned to a specific water use category.

Step 2: Estimate Direct and Indirect Economic Impacts of Water Needs

Direct impacts are reductions in output by sectors experiencing water shortages. For example, without adequate cooling and process water a refinery would have to curtail or cease operation, car washes may close, or farmers may not be able to irrigate and sales revenues fall. Indirect impacts involve changes in inter-industry transactions as supplying industries respond to decreased demands for their services, and how seemingly non-related businesses are affected by decreased incomes and spending due to direct impacts. For example, if a farmer ceases operations due to a lack of irrigation water, they would likely reduce expenditures on supplies such as fertilizer, labor and equipment, and businesses that provide these goods would suffer as well.

Direct impacts accrue to immediate businesses and industries that rely on water and without water industrial processes could suffer. However, output responses may vary depending upon the severity of shortages. A small shortage relative to total water use would likely have a minimal impact, but large shortages could be critical. For example, farmers facing small shortages might fallow marginally productive acreage to save water for more valuable crops. Livestock producers might employ emergency culling strategies, or they may consider hauling water by truck to fill stock tanks. In the case of manufacturing, a good example occurred in the summer of 1999 when Toyota Motor Manufacturing experienced water shortages at a facility near Georgetown, Kentucky.² As water levels in the Kentucky River fell to historic lows due to drought, plant managers sought ways to curtail water use such as reducing rinse operations to a bare minimum and recycling water by funneling it from paint shops to boilers. They even considered trucking in water at a cost of 10 times what they were paying. Fortunately, rains at the end of the summer restored river levels, and Toyota managed to implement cutbacks without affecting production, but it was a close call. If rains had not replenished the river, shortages could have severely reduced output.³

To account for uncertainty regarding the relative magnitude of impacts to farm and business operations, the following analysis employs the concept of elasticity. Elasticity is a number that shows how a change in one variable will affect another. In this case, it measures the relationship between a percentage reduction in water availability and a percentage reduction in output. For example, an elasticity of 1.0 indicates that a 1.0 percent reduction in water availability would result in a 1.0 percent reduction in economic output. An elasticity of 0.50 would indicate that for every 1.0 percent of unavailable water, output is reduced by 0.50 percent and so on. Output elasticities used in this study are:⁴

² Royal, W. "High And Dry - Industrial Centers Face Water Shortages." in Industry Week, Sept, 2000.

³ The efforts described above are not planned programmatic or long-term operational changes. They are emergency measures that individuals might pursue to alleviate what they consider a temporary condition. Thus, they are not characteristic of long-term management strategies designed to ensure more dependable water supplies such as capital investments in conservation technology or development of new water supplies.

⁴ Elasticities are based on one of the few empirical studies that analyze potential relationships between economic output and water shortages in the United States. The study, conducted in California, showed that a significant number of industries would suffer reduced output during water shortages. Using a survey based approach researchers posed two scenarios to different industries. In

- if water needs are 0 to 5 percent of total water demand, no corresponding reduction in output is assumed;
- if water needs are 5 to 30 percent of total water demand, for each additional one percent of water need that is not met, there is a corresponding 0.50 percent reduction in output;
- if water needs are 30 to 50 percent of total water demand, for each additional one percent of water need that is not met, there is a corresponding 0.75 percent reduction in output; and
- if water needs are greater than 50 percent of total water demand, for each additional one percent of water need that is not met, there is a corresponding 1.0 percent (i.e., a proportional reduction).

In some cases, elasticities are adjusted depending upon conditions specific to a given water user group.

Once output responses to water shortages were estimated, direct impacts to total sales, employment, regional income and business taxes were derived using regional level economic multipliers estimating using IO/SAM models. The formula for a given IMPLAN sector is:

$$D_{i,t} = Q_{i,t} *_{,} S_{i,t} *_{,} E_{Q} *_{,} RFD_{i} *_{,} DM_{i(Q,L,I,T)}$$

where:

 $D_{i,t}$ = direct economic impact to sector i in period t

 $Q_{i,t}$ = total sales for sector *i* in period *t* in an affected county

RFD_{i.} = ratio of final demand to total sales for sector *i* for a given region

 $S_{i,t}$ = water shortage as percentage of total water use in period t

 E_0 = elasticity of output and water use

 $DM_{i(L,I,T)}$ = direct output multiplier coefficients for labor (L), income (I) and taxes (T) for sector i.

Secondary impacts were derived using the same formula used to estimate direct impacts; however, indirect multiplier coefficients are used. Methods and assumptions specific to each water use sector are discussed in Sections 1.1.2 through 1.1.4.

the first scenario, they asked how a 15 percent cutback in water supply lasting one year would affect operations. In the second scenario, they asked how a 30 percent reduction lasting one year would affect plant operations. In the case of a 15 percent shortage, reported output elasticities ranged from 0.00 to 0.76 with an average value of 0.25. For a 30 percent shortage, elasticities ranged from 0.00 to 1.39 with average of 0.47. For further information, see, California Urban Water Agencies, "Cost of Industrial Water Shortages," Spectrum Economics, Inc. November, 1991.

General Assumptions and Clarification of the Methodology

As with any attempt to measure and quantify human activities at a societal level, assumptions are necessary and every model has limitations. Assumptions are needed to maintain a level of generality and simplicity such that models can be applied on several geographic levels and across different economic sectors. In terms of the general approach used here several clarifications and cautions are warranted:

- 1. Shortages as reported by regional planning groups are the starting point for socioeconomic analyses.
- 2. Estimated impacts are point estimates for years in which needs are reported (i.e., 2010, 2020, 2030, 2040, 2050 and 2060). They are independent and distinct "what if" scenarios for each particular year and water shortages are assumed to be temporary events resulting from severe drought conditions combined with infrastructure limitations. In other words, growth occurs and future shocks are imposed on an economy at 10-year intervals and resultant impacts are measured. Given, that reported figures are not cumulative in nature, it is inappropriate to sum impacts over the entire planning horizon. Doing so, would imply that the analysis predicts that drought of record conditions will occur every ten years in the future, which is not the case. Similarly, authors of this report recognize that in many communities needs are driven by population growth, and in the future total population will exceed the amount of water available due to infrastructure limitations, regardless of whether or not there is a drought. This implies that infrastructure limitations would constrain economic growth. However, since needs as defined by planning rules are based upon water supply and demand under the assumption of drought of record conditions, it improper to conduct economic analysis that focuses on growth related impacts over the planning horizon. Figures generated from such an analysis would presume a 50-year drought of record, which is unrealistic. Estimating lost economic activity related to constraints on population and commercial growth due to lack of water would require developing water supply and demand forecasts under "normal" or "most likely" future climatic conditions.
- 3. While useful for planning purposes, this study is not a benefit-cost analysis. Benefit cost analysis is a tool widely used to evaluate the economic feasibility of specific policies or projects as opposed to estimating economic impacts of unmet water needs. Nevertheless, one could include some impacts measured in this study as part of a benefit cost study if done so properly. Since this is not a benefit cost analysis, future impacts are not weighted differently. In other words, estimates are not discounted. If used as a measure of economic benefits, one should incorporate a measure of uncertainty into the analysis. In this type of analysis, a typical method of discounting future values is to assign probabilities of the drought of record recurring again in a given year, and weight monetary impacts accordingly. This analysis assumes a probability of one.
- 4. IO multipliers measure the strength of backward linkages to supporting industries (i.e., those who sell inputs to an affected sector). However, multipliers say nothing about forward linkages consisting of businesses that purchase goods from an affected sector for further processing. For example, ranchers in many areas sell most of their animals to local meat packers who process animals into a form that consumers ultimately see in grocery stores and restaurants. Multipliers do not capture forward linkages to meat packers, and since meat packers sell livestock purchased from ranchers as "final sales," multipliers for the ranching sector do fully account for all losses to a region's economy. Thus, as mentioned previously, in some cases closely linked sectors were moved from one water use category to another.
- 5. Cautions regarding interpretations of direct and secondary impacts are warranted. IO/SAM multipliers are based on "fixed-proportion production functions," which basically means that input use including labor moves in lockstep fashion with changes in levels of output. In a

scenario where output (i.e., sales) declines, losses in the immediate sector or supporting sectors could be much less than predicted by an IO/SAM model for several reasons. For one, businesses will likely expect to continue operating so they might maintain spending on inputs for future use; or they may be under contractual obligations to purchase inputs for an extended period regardless of external conditions. Also, employers may not lay-off workers given that experienced labor is sometimes scarce and skilled personnel may not be readily available when water shortages subside. Lastly people who lose jobs might find other employment in the region. As a result, direct losses for employment and secondary losses in sales and employment should be considered an upper bound. Similarly, since projected population losses are based on reduced employment in the region, they should be considered an upper bound as well.

- 6. IO models are static. Models and resultant multipliers are based upon the structure of the U.S. and regional economies in 2006. In contrast, water shortages are projected to occur well into the future. Thus, the analysis assumes that the general structure of the economy remains the same over the planning horizon, and the farther out into the future we go, this assumption becomes less reliable.
- 7. Impacts are annual estimates. If one were to assume that conditions persisted for more than one year, figures should be adjusted to reflect the extended duration. The drought of record in most regions of Texas lasted several years.
- 8. Monetary figures are reported in constant year 2006 dollars.

1.1.2 Impacts to Agriculture

Irrigated Crop Production

The first step in estimating impacts to irrigation required calculating gross sales for IMPLAN crop sectors. Default IMPLAN data do not distinguish irrigated production from dry-land production. Once gross sales were known other statistics such as employment and income were derived using IMPLAN direct multiplier coefficients. Gross sales for a given crop are based on two data sources:

- 1) county-level statistics collected and maintained by the TWDB and the USDA Farm Services Agency (FSA) including the number of irrigated acres by crop type and water application per acre, and
- 2) regional-level data published by the Texas Agricultural Statistics Service (TASS) including prices received for crops (marketing year averages), crop yields and crop acreages.

Crop categories used by the TWDB differ from those used in IMPLAN datasets. To maintain consistency, sales and other statistics are reported using IMPLAN crop classifications. Table 1 shows the TWDB crops included in corresponding IMPLAN sectors, and Table 2 summarizes acreage and estimated annual water use for each crop classification (five-year average from 2003-2007). Table 3 displays average (2003-2007) gross revenues per acre for IMPLAN crop categories.

Table 1: Crop Classifications Used in TWDB Water Use Survey and Corresponding IMPLAN Crop Sectors				
IMPLAN Category TWDB Category				
Oilseeds	Soybeans and "other oil crops"			
Grains	Grain sorghum, corn, wheat and "other grain crops"			
Vegetable and melons	"Vegetables" and potatoes			
Tree nuts	Pecans			
Fruits Citrus, vineyard and other orchard				
Cotton Cotton				
Sugarcane and sugar beets Sugarcane and sugar beets				
All "other" crops "Forage crops", peanuts, alfalfa, hay and pasture, rice and "all other crops"				

Table 2: Summary of Irrigated Crop Acreage and Water Demand for the East Texas Regional Water Planning Area (average 2003-2007)					
Acres Distribution of Water use Distribution of water Sector (1000s) acres (1000s of AF) use					
Grains	<1	<1%	<1	<1%	
Vegetable and melons	<1	3%	<1	<1%	
Fruits	<1	<1%	<1%	<1%	
Cotton	<1	2%	0.58	1%	
Rice	22	93%	108	99%	
Total	23	100%	109	100%	

Source: Water demand figures are a 5- year average (2003-2007) of the TWDB's annual Irrigation Water Use Estimates. Statistics for irrigated crop acreage are based upon annual survey data collected by the TWDB and the Farm Service Agency. Values do not include acreage or water use for the TWDB categories classified by the Farm Services Agency as "failed acres," "golf course" or "waste water."

IMPLAN Sector	Gross revenues per acre	Crops included in estimates
Grains	\$442	Based on five-year (2003-2007) average weighted by acreage for "irrigated grain sorghum," "irrigated corn", "irrigated wheat" and "irrigated 'other' grain crops."
Vegetable and melons	\$6,184	Based on five-year (2003-2007) average weighted by acreage for "irrigated shallow and deep root vegetables", "irrigated Irish potatoes" and "irrigated melons."
Fruits	\$3,502	Based on five-year (2003-2007) average weighted by acreage for "irrigated citrus", "irrigated vineyards" and "irrigated 'other' orchard."
Cotton	\$400	Based on five-year (2003-2007) average weighted by acreage for "irrigated cotton."
All Other Crops	\$500	Irrigated figure is based on five-year (2003-2007) average weighted by acreage for "irrigated 'forage' crops", "irrigated peanuts", "irrigated alfalfa", "irrigated 'hay' and pasture" and "irrigated 'all other' crops."

An important consideration when estimating impacts to irrigation was determining which crops are affected by water shortages. One approach is the so-called rationing model, which assumes that farmers respond to water supply cutbacks by fallowing the lowest value crops in the region first and the highest valued crops last until the amount of water saved equals the shortage. For example, if farmer A grows vegetables (higher value) and farmer B grows wheat (lower value) and they both face a proportionate cutback in irrigation water, then farmer B will sell water to farmer A. Farmer B will fallow her irrigated acreage before farmer A fallows anything. Of course, this assumes that farmers can and do transfer enough water to allow this to happen. A different approach involves constructing farm-level profit maximization models that conform to widely-accepted economic theory that farmers make decisions based on marginal net returns. Such models have good predictive capability, but data requirements and complexity are high. Given that a detailed analysis for each region would require a substantial amount of farm-level data and analysis, the following investigation assumes that projected shortages are distributed equally across predominant crops in the region. Predominant in this case are crops that comprise at least one percent of total acreage in the region.

The following steps outline the overall process used to estimate direct impacts to irrigated agriculture:

- 1. Distribute shortages across predominant crop types in the region. Again, unmet water needs were distributed equally across crop sectors that constitute one percent or more of irrigated acreage.
- 2. Estimate associated reductions in output for affected crop sectors. Output reductions are based on elasticities discussed previously and on estimated values per acre for different crops. Values per acre stem from the same data used to estimate output for the year 2006 baseline. Using multipliers, we then generate estimates of forgone income, jobs, and tax revenues based on reductions in gross sales and final demand.

Livestock

The approach used for the livestock sector is basically the same as that used for crop production. As is the case with crops, livestock categorizations used by the TWDB differ from those used in IMPLAN datasets, and TWDB groupings were assigned to a given IMPLAN sector (Table 4). Then we:

1) Distribute projected water needs equally among predominant livestock sectors and estimate lost output: As is the case with irrigation, shortages are assumed to affect all livestock sectors equally; however, the category of "other" is not included given its small size. If water needs were small relative to total demands, we assume that producers would haul in water by truck to fill stock tanks. The cost per acre-foot (\$24,000) is based on 2008 rates charged by various water haulers in Texas, and assumes that the average truck load is 6,500 gallons at a hauling distance of 60 miles.

3) Estimate reduced output in forward processors for livestock sectors. Reductions in output for livestock sectors are assumed to have a proportional impact on forward processors in the region such as meat packers. In other words, if the cows were gone, meat-packing plants or fluid milk manufacturers) would likely have little to process. This is not an unreasonable premise. Since the

_

⁵ The rationing model was initially proposed by researchers at the University of California at Berkeley, and was then modified for use in a study conducted by the U.S. Environmental Protection Agency that evaluated how proposed water supply cutbacks recommended to protect water quality in the Bay/Delta complex in California would affect farmers in the Central Valley. See, Zilberman, D., Howitt, R. and Sunding, D. "Economic Impacts of Water Quality Regulations in the San Francisco Bay and Delta." Western Consortium for Public Health. May 1993.

1950s, there has been a major trend towards specialized cattle feedlots, which in turn has decentralized cattle purchasing from livestock terminal markets to direct sales between producers and slaughterhouses. Today, the meat packing industry often operates large processing facilities near high concentrations of feedlots to increase capacity utilization. As a result, packers are heavily dependent upon nearby feedlots. For example, a recent study by the USDA shows that on average meat packers obtain 64 percent of cattle from within 75 miles of their plant, 82 percent from within 150 miles and 92 percent from within 250 miles.

Table 4: Description of Livestock Sectors				
IMPLAN Category	TWDB Category			
Cattle ranching and farming	Cattle, cow calf, feedlots and dairies			
Poultry and egg production	Poultry production.			
Other livestock	Livestock other than cattle and poultry (i.e., horses, goats, sheep, hogs)			
Milk manufacturing	Fluid milk manufacturing, cheese manufacturing, ice cream manufacturing etc.			
Meat packing	Meat processing present in the region from slaughter to final processing			

1.1.3 Impacts to Municipal Water User Groups

Disaggregation of Municipal Water Demands

Estimating the economic impacts for the municipal water user groups is complicated for a number of reasons. For one, municipal use comprises a range of consumers including commercial businesses, institutions such as schools and government and households. However, reported water needs are not distributed among different municipal water users. In other words, how much of a municipal need is commercial and how much is residential (domestic)?

The amount of commercial water use as a percentage of total municipal demand was estimated based on "GED" coefficients (gallons per employee per day) published in secondary sources. For example, if year 2006 baseline data for a given economic sector (e.g., amusement and recreation services) shows employment at 30 jobs and the GED coefficient is 200, then average daily water use by that sector is (30 x

J., and Sims, J. H., 1981, "Evaluation of Water Conservation for Municipal and Industrial Water Supply." U.S. Army Corps of Engineers, Institute for Water Resources. Contract no. 82-C1.

200 = 6,000 gallons) or 6.7 acre-feet per year. Water not attributed to commercial use is considered domestic, which includes single and multi-family residential consumption, institutional uses and all use designated as "county-other." Based on our analysis, commercial water use is about 5 to 35 percent of municipal demand. Less populated rural counties occupy the lower end of the spectrum, while larger metropolitan counties are at the higher end.

After determining the distribution of domestic versus commercial water use, we developed methods for estimating impacts to the two groups.

Domestic Water Uses

Input output models are not well suited for measuring impacts of shortages for domestic water uses, which make up the majority of the municipal water use category. To estimate impacts associated with domestic water uses, municipal water demand and needs are subdivided into residential, and commercial and institutional use. Shortages associated with residential water uses are valued by estimating proxy demand functions for different water user groups allowing us to estimate the marginal value of water, which would vary depending upon the level of water shortages. The more severe the water shortage, the more costly it becomes. For instance, a 2 acre-foot shortage for a group of households that use 10 acre-feet per year would not be as severe as a shortage that amounted to 8 acre-feet. In the case of a 2 acre-foot shortage, households would probably have to eliminate some or all outdoor water use, which could have implicit and explicit economic costs including losses to the horticultural and landscaping industry. In the case of an 8 acre-foot shortage, people would have to forgo all outdoor water use and most indoor water consumption. Economic impacts would be much higher in the latter case because people, and would be forced to find emergency alternatives assuming alternatives were available.

To estimate the value of domestic water uses, TWDB staff developed marginal loss functions based on constant elasticity demand curves. This is a standard and well-established method used by economists to value resources such as water that have an explicit monetary cost.

A constant price elasticity of demand is estimated using a standard equation:

$$w = kc^{(-\varepsilon)}$$

where:

- w is equal to average monthly residential water use for a given water user group measured in thousands of gallons;
- k is a constant intercept;
- c is the average cost of water per 1,000 gallons; and
- ϵ is the price elasticity of demand.

Price elasticities (-0.30 for indoor water use and -0.50 for outdoor use) are based on a study by Bell et al. ⁹ that surveyed 1,400 water utilities in Texas that serve at least 1,000 people to estimate demand elasticity for several variables including price, income, weather etc. Costs of water and average use per month per household are based on data from the Texas Municipal League's annual water and

⁹ Bell, D.R. and Griffin, R.C. "Community Water Demand in Texas as a Century is Turned." Research contract report prepared for the Texas Water Development Board. May 2006.

wastewater rate surveys - specifically average monthly household expenditures on water and wastewater in different communities across the state. After examining variance in costs and usage, three different categories of water user groups based on population (population less than 5,000, cities with populations ranging from 5,000 to 99,999 and cities with populations exceeding 100,000) were selected to serve as proxy values for municipal water groups that meet the criteria (Table 5).¹⁰

Table 5: Water Use and Costs Parameters Used to Estimated Water Demand Functions
(average monthly costs per acre-foot for delivered water and average monthly use per household)

Community Population	Water	Wastewater	Total monthly cost	Avg. monthly use (gallons)
Less than or equal to 5,000	\$1,335	\$1,228	\$2,563	6,204
5,000 to 100,000	\$1,047	\$1,162	\$2,209	7,950
Great than or equal to 100,000	\$718	\$457	\$1,190	8,409

Source: Based on annual water and wastewater rate surveys published by the Texas Municipal League.

As an example, Table 6 shows the economic impact per acre-foot of domestic water needs for municipal water user groups with population exceeding 100,000 people. There are several important assumptions incorporated in the calculations:

- 1) Reported values are net of the variable costs of treatment and distribution such as expenses for chemicals and electricity since using less water involves some savings to consumers and utilities alike; and for outdoor uses we do not include any value for wastewater.
- 2) Outdoor and "non-essential" water uses would be eliminated before indoor water consumption was affected, which is logical because most water utilities in Texas have drought contingency plans that generally specify curtailment or elimination of outdoor water use during droughts.¹¹ Determining how much water is used for outdoor purposes is based on several secondary sources. The first is a major study sponsored by the American Water Works Association, which surveyed cities in states including Colorado, Oregon, Washington, California, Florida and Arizona. On average across all cities surveyed 58 percent of single family residential water use was for outdoor activities. In cities with climates comparable to large metropolitan areas of Texas, the average was 40 percent.¹² Earlier findings of the U.S. Water Resources Council showed a national

¹¹ In Texas, state law requires retail and wholesale water providers to prepare and submit plans to the Texas Commission on Environmental Quality (TCEQ). Plans must specify demand management measures for use during drought including curtailment of "non-essential water uses." Non-essential uses include, but are not limited to, landscape irrigation and water for swimming pools or fountains. For further information see the Texas Environmental Quality Code §288.20.

15

¹⁰ Ideally, one would want to estimate demand functions for each individual utility in the state. However, this would require an enormous amount of time and resources. For planning purposes, we believe the values generated from aggregate data are more than sufficient.

¹² See, Mayer, P.W., DeOreo, W.B., Opitz, E.M., Kiefer, J.C., Davis, W., Dziegielewski, D., Nelson, J.O. "Residential End Uses of Water." Research sponsored by the American Water Works Association and completed by Aquacraft, Inc. and Planning and Management Consultants, Ltd. (PMCL@CDM).

average of 33 percent. Similarly, the United States Environmental Protection Agency (USEPA) estimated that landscape watering accounts for 32 percent of total residential and commercial water use on annual basis.¹³ A study conducted for the California Urban Water Agencies (CUWA) calculated average annual values ranging from 25 to 35 percent.¹⁴ Unfortunately, there does not appear to be any comprehensive research that has estimated non-agricultural outdoor water use in Texas. As an approximation, an average annual value of 30 percent based on the above references was selected to serve as a rough estimate in this study.

3) As shortages approach 100 percent values become immense and theoretically infinite at 100 percent because at that point death would result, and willingness to pay for water is immeasurable. Thus, as shortages approach 80 percent of monthly consumption, we assume that households and non-water intensive commercial businesses (those that use water only for drinking and sanitation would have water delivered by tanker truck or commercial water delivery companies. Based on reports from water companies throughout the state, we estimate that the cost of trucking in water is around \$21,000 to \$27,000 per acre-feet assuming a hauling distance of between 20 to 60 miles. This is not an unreasonable assumption. The practice was widespread during the 1950s drought and recently during droughts in this decade. For example, in 2000 at the heels of three consecutive drought years Electra - a small town in North Texas - was down to its last 45 days worth of reservoir water when rain replenished the lake, and the city was able to refurbish old wells to provide supplemental groundwater. At the time, residents were forced to limit water use to 1,000 gallons per person per month - less than half of what most people use - and many were having water delivered to their homes by private contractors. 15 In 2003 citizens of Ballinger, Texas, were also faced with a dwindling water supply due to prolonged drought. After three years of drought, Lake Ballinger, which supplies water to more than 4,300 residents in Ballinger and to 600 residents in nearby Rowena, was almost dry. Each day, people lined up to get water from a well in nearby City Park. Trucks hauling trailers outfitted with large plastic and metal tanks hauled water to and from City Park to Ballinger. 16

Table 6: Economic Losses Associated with Domestic Water Shortages in Communities with Populations Exceeding 100,000 people Water shortages as a No. of gallons No of gallons percentage of total **Economic loss Economic loss** remaining per remaining per person monthly household (per acre-foot) (per gallon) household per day per day demands \$0.00005 1% 278 93 \$748 5% 89 \$0.0002 266 \$812 10% 252 84 \$900 \$0.0005 238 79 \$999 \$0.0008 15% 20% 224 75 \$1,110 \$0.0012 25% 210 70 \$1,235 \$0.0015 30%^a 196 65 \$1,699 \$0.0020 35% 182 61 \$3,825 \$0.0085 40% 168 \$0.0096 56 \$4,181 154 \$4,603 \$0.011 45% 51 50% 140 47 \$5,109 \$0.012 55% 126 42 \$5,727 \$0.014 60% 37 \$6,500 \$0.017 112 65% 98 33 \$7,493 \$0.02 70% 84 28 \$8,818 \$0.02 75% 70 23 \$10,672 \$0.03 80% 56 19 \$13,454 \$0.04 42 \$0.05 (\$0.07)^b 85% 14 \$18,091 (\$24,000)^b 90% 28 9 \$27,363 (\$24,000) \$0.08 (\$0.07) 95% 5 \$55,182 (\$24,000) \$0.17 (\$0.07) 14 99% 3 0.9 \$277,728 (\$24,000) \$0.85 (\$0.07) 99.9% 1 0.5 \$2,781,377 (\$24,000) \$8.53 (\$0.07) 100% 0 0 Infinite (\$24,000)Infinite (\$0.07)

^a The first 30 percent of needs are assumed to be restrictions of outdoor water use; when needs reach 30 percent of total demands all outdoor water uses would be restricted. Needs greater than 30 percent include indoor use

^b As shortages approach 100 percent the value approaches infinity assuming there are not alternatives available; however, we assume that communities would begin to have water delivered by tanker truck at an estimated cost of \$24,000 per acre-foot when shortages breached 85 percent.

Commercial Businesses

Effects of water shortages on commercial sectors were estimated in a fashion similar to other business sectors meaning that water shortages would affect the ability of these businesses to operate. This is particularly true for "water intensive" commercial sectors that are need large amounts of water (in addition to potable and sanitary water) to provide their services. These include:

- car-washes,
- laundry and cleaning facilities,
- sports and recreation clubs and facilities including race tracks,
- amusement and recreation services,
- hospitals and medical facilities,
- hotels and lodging places, and
- eating and drinking establishments.

A key assumption is that commercial operations would not be affected until water shortages were at least 50 percent of total municipal demand. In other words, we assume that residential water consumers would reduce water use including all non-essential uses before businesses were affected.

An example will illustrate the breakdown of municipal water needs and the overall approach to estimating impacts of municipal needs. Assume City A experiences an unexpected shortage of 50 acrefeet per year when their demands are 200 acre-feet per year. Thus, shortages are only 25 percent of total municipal use and residents of City A could eliminate needs by restricting landscape irrigation. City B, on the other hand, has a deficit of 150 acre-feet in 2020 and a projected demand of 200 acre-feet. Thus, total shortages are 75 percent of total demand. Emergency outdoor and some indoor conservation measures could eliminate 50 acre-feet of projected needs, yet 50 acre-feet would still remain. To eliminate" the remaining 50 acre-feet water intensive commercial businesses would have to curtail operations or shut down completely.

Three other areas were considered when analyzing municipal water shortages: 1) lost revenues to water utilities, 2) losses to the horticultural and landscaping industries stemming for reduction in water available for landscape irrigation, and 3) lost revenues and related economic impacts associated with reduced water related recreation.

Water Utility Revenues

Estimating lost water utility revenues was straightforward. We relied on annual data from the "Water and Wastewater Rate Survey" published annually by the Texas Municipal League to calculate an average value per acre-foot for water and sewer. For water revenues, average retail water and sewer rates multiplied by total water needs served as a proxy. For lost wastewater, total unmet needs were adjusted for return flow factor of 0.60 and multiplied by average sewer rates for the region. Needs reported as "county-other" were excluded under the presumption that these consist primarily of self-supplied water uses. In addition, 15 percent of water demand and needs are considered non-billed or "unaccountable" water that comprises things such as leakages and water for municipal government functions (e.g., fire departments). Lost tax receipts are based on current rates for the "miscellaneous gross receipts tax, "which the state collects from utilities located in most incorporated cities or towns in Texas. We do not include lost water utility revenues when aggregating impacts of municipal water shortages to regional and state levels to prevent double counting.

Horticultural and Landscaping Industry

The horticultural and landscaping industry, also referred to as the "green Industry," consists of businesses that produce, distribute and provide services associated with ornamental plants, landscape and garden supplies and equipment. Horticultural industries often face big losses during drought. For example, the recent drought in the Southeast affecting the Carolinas and Georgia horticultural and landscaping businesses had a harsh year. Plant sales were down, plant mortality increased, and watering costs increased. Many businesses were forced to close locations, lay off employees, and even file for bankruptcy. University of Georgia economists put statewide losses for the industry at around \$3.2 billion during the 3-year drought that ended in 2008. Municipal restrictions on outdoor watering play a significant role. During drought, water restrictions coupled with persistent heat has a psychological effect on homeowners that reduces demands for landscaping products and services. Simply put, people were afraid to spend any money on new plants and landscaping.

In Texas, there do not appear to be readily available studies that analyze the economic effects of water shortages on the industry. However, authors of this report believe negative impacts do and would result in restricting landscape irrigation to municipal water consumers. The difficulty in measuring them is two-fold. First, as noted above, data and research for these types of impacts that focus on Texas are limited; and second, economic data provided by IMPLAN do not disaggregate different sectors of the green industry to a level that would allow for meaningful and defensible analysis. ¹⁸
Recreational Impacts

Recreational businesses often suffer when water levels and flows in rivers, springs and reservoirs fall significantly during drought. During droughts, many boat docks and lake beaches are forced to close, leading to big losses for lakeside business owners and local communities. Communities adjacent to popular river and stream destinations such as Comal Springs and the Guadalupe River also see their business plummet when springs and rivers dry up. Although there are many examples of businesses that have suffered due to drought, dollar figures for drought-related losses to the recreation and tourism industry are not readily available, and very difficult to measure without extensive local surveys. Thus, while they are important, economic impacts are not measured in this study.

Table 7 summarizes impacts of municipal water shortages at differing levels of magnitude, and shows the ranges of economic costs or losses per acre-foot of shortage for each level.

¹⁷ Williams, D. "Georgia landscapers eye rebound from Southeast drought." Atlanta Business Chronicle, Friday, June 19, 2009

¹⁸ Economic impact analyses prepared by the TWDB for 2006 regional water plans did include estimates for the horticultural industry. However, year 2000 and prior IMPLAN data were disaggregated to a finer level. In the current dataset (2006), the sector previously listed as "Landscaping and Horticultural Services" (IMPLAN Sector 27) is aggregated into "Services to Buildings and Dwellings" (IMPLAN Sector 458).

Table 7: Impacts of Municipal Water Shortages at Different Magnitudes of Shortages					
Water shortages as percent of total municipal demands	Impacts	Economic costs per acre-foot*			
0-30%	 ✓ Lost water utility revenues ✓ Restricted landscape irrigation and non- essential water uses 	\$730 - \$2,040			
30-50%	 ✓ Lost water utility revenues ✓ Elimination of landscape irrigation and non-essential water uses ✓ Rationing of indoor use 	\$2,040 - \$10,970			
>50%	 ✓ Lost water utility revenues ✓ Elimination of landscape irrigation and non-essential water uses ✓ Rationing of indoor use ✓ Restriction or elimination of commercial water use ✓ Importing water by tanker truck 	\$10,970 - varies

1.1.4 Industrial Water User Groups

Manufacturing

Impacts to manufacturing were estimated by distributing water shortages among industrial sectors at the county level. For example, if a planning group estimates that during a drought of record water supplies in County A would only meet 50 percent of total annual demands for manufactures in the county, we reduced output for each sector by 50 percent. Since projected manufacturing demands are based on TWDB Water Uses Survey data for each county, we only include IMPLAN sectors represented in the TWBD survey database. Some sectors in IMPLAN databases are not part of the TWDB database given that they use relatively small amounts of water - primarily for on-site sanitation and potable purposes. To maintain consistency between IMPLAN and TWDB databases, Standard Industrial Classification (SIC) codes both databases were cross referenced in county with shortages. Non-matches were excluded when calculating direct impacts.

Mining

The process of mining is very similar to that of manufacturing. We assume that within a given county, shortages would apply equally to relevant mining sectors, and IMPLAN sectors are cross referenced with TWDB data to ensure consistency.

In Texas, oil and gas extraction and sand and gravel (aggregates) operations are the primary mining industries that rely on large volumes of water. For sand and gravel, estimated output reductions are straightforward; however, oil and gas is more complicated for a number of reasons. IMPLAN does not necessarily report the physical extraction of minerals by geographic local, but rather the sales revenues reported by a particular corporation.

For example, at the state level revenues for IMPLAN sector 19 (oil and gas extraction) and sector 27 (drilling oil and gas wells) totals \$257 billion. Of this, nearly \$85 billion is attributed to Harris County. However, only a very small fraction (less than one percent) of actual production takes place in the county. To measure actual potential losses in well head capacity due to water shortages, we relied on county level production data from the Texas Railroad Commission (TRC) and average well-head market prices for crude and gas to estimate lost revenues in a given county. After which, we used to IMPLAN ratios to estimate resultant losses in income and employment.

Other considerations with respect to mining include:

- 1) Petroleum and gas extraction industry only uses water in significant amounts for secondary recovery. Known in the industry as enhanced or water flood extraction, secondary recovery involves pumping water down injection wells to increase underground pressure thereby pushing oil or gas into other wells. IMPLAN output numbers do not distinguish between secondary and non-secondary recovery. To account for the discrepancy, county-level TRC data that show the proportion of barrels produced using secondary methods were used to adjust IMPLAN data to reflect only the portion of sales attributed to secondary recovery.
- 2) A substantial portion of output from mining operations goes directly to businesses that are classified as manufacturing in our schema. Thus, multipliers measuring backward linkages for a given manufacturer might include impacts to a supplying mining operation. Care was taken not to double count in such situations if both a mining operation and a manufacturer were reported as having water shortages.

Steam-electric

At minimum without adequate cooling water, power plants cannot safely operate. As water availability falls below projected demands, water levels in lakes and rivers that provide cooling water would also decline. Low water levels could affect raw water intakes and outfalls at electrical generating units in several ways. For one, power plants are regulated by thermal emission guidelines that specify the maximum amount of heat that can go back into a river or lake via discharged cooling water. Low water levels could result in permit compliance issues due to reduced dilution and dispersion of heat and subsequent impacts on aquatic biota near outfalls. However, the primary concern would be a loss of head (i.e., pressure) over intake structures that would decrease flows through intake tunnels. This would affect safety related pumps, increase operating costs and/or result in sustained shut-downs. Assuming plants did shutdown, they would not be able to generate electricity.

¹⁹ Section 316 (b) of the Clean Water Act requires that thermal wastewater discharges do not harm fish and other wildlife.

Among all water use categories steam-electric is unique and cautions are needed when applying methods used in this study. Measured changes to an economy using input-output models stem directly from changes in sales revenues. In the case of water shortages, one assumes that businesses will suffer lost output if process water is in short supply. For power generation facilities this is true as well. However, the electric services sector in IMPLAN represents a corporate entity that may own and operate several electrical generating units in a given region. If one unit became inoperable due to water shortages, plants in other areas or generation facilities that do not rely heavily on water such as gas powered turbines might be able to compensate for lost generating capacity. Utilities could also offset lost production via purchases on the spot market. Thus, depending upon the severity of the shortages and conditions at a given electrical generating unit, energy supplies for local and regional communities could be maintained. But in general, without enough cooling water, utilities would have to throttle back plant operations, forcing them to buy or generate more costly power to meet customer demands.

Measuring impacts end users of electricity is not part of this study as it would require extensive local and regional level analysis of energy production and demand. To maintain consistency with other water user groups, impacts of steam-electric water shortages are measured in terms of lost revenues (and hence income) and jobs associated with shutting down electrical generating units.

1.2 Social Impacts of Water Shortages

As the name implies, the effects of water shortages can be social or economic. Distinctions between the two are both semantic and analytical in nature – more so analytic in the sense that social impacts are harder to quantify. Nevertheless, social effects associated with drought and water shortages are closely tied to economic impacts. For example, they might include:

- demographic effects such as changes in population,
- disruptions in institutional settings including activity in schools and government,
- conflicts between water users such as farmers and urban consumers,
- health-related low-flow problems (e.g., cross-connection contamination, diminished sewage flows, increased pollutant concentrations),
- mental and physical stress (e.g., anxiety, depression, domestic violence),
- public safety issues from forest and range fires and reduced fire fighting capability,
- increased disease caused by wildlife concentrations,
- loss of aesthetic and property values, and
- reduced recreational opportunities.²¹

²⁰ Today, most utilities participate in large interstate "power pools" and can buy or sell electricity "on the grid" from other utilities or power marketers. Thus, assuming power was available to buy, and assuming that no contractual or physical limitations were in place such as transmission constraints; utilities could offset lost power that resulted from waters shortages with purchases via the power grid.

²¹ Based on information from the website of the National Drought Mitigation Center at the University of Nebraska Lincoln. Available online at: http://www.drought.unl.edu/risk/impacts.htm. See also, Vanclay, F. "Social Impact Assessment." in Petts, J. (ed) International Handbook of Environmental Impact Assessment. 1999.

Social impacts measured in this study focus strictly on demographic effects including changes in population and school enrollment. Methods are based on demographic projection models developed by the Texas State Data Center and used by the TWDB for state and regional water planning. Basically, the social impact model uses results from the economic component of the study and assesses how changes in labor demand would affect migration patterns in a region. Declines in labor demand as measured using adjusted IMPLAN data are assumed to affect net economic migration in a given regional water planning area. Employment losses are adjusted to reflect the notion that some people would not relocate but would seek employment in the region and/or public assistance and wait for conditions to improve. Changes in school enrollment are simply the proportion of lost population between the ages of 5 and 17.

2. Results

Section 2 presents the results of the analysis at the regional level. Included are baseline economic data for each water use category, and estimated economics impacts of water shortages for water user groups with reported deficits. According to the 2011 *Rio Grande Regional Water Plan*, during severe drought irrigation, livestock, municipal, manufacturing, mining and steam-electric water user groups would experience water shortages in the absence of new water management strategies.

2.1 Overview of Regional Economy

On an annual basis, the East Texas regional economy generates \$34 billion in gross state product for Texas (\$32 billion in income and \$2 billion worth of business taxes) and supports 481,393 jobs (Table 8). Generating about \$12 billion worth of income per year, agriculture, manufacturing, and mining are the primary base economic sectors in the region. 22 Municipal sectors also generate substantial amounts of income and are major employers. However, while municipal sectors are the largest employer and source of wealth, many businesses that make up the municipal category such as restaurants and retail stores are non-basic industries meaning they exist to provide services to people who work would in base industries such as manufacturing, agriculture and mining. In other words, without base industries such agriculture, many municipal jobs in the region would not exist.

-

²² Base industries are those that supply markets outside of the region. These industries are crucial to the local economy and are called the economic base of a region. Appendix A shows how IMPLAN's 529 sectors were allocated to water use category, and shows economic data for each sector.

Table 8: The East Texas Regional Economy by Water User Group (\$millions)*						
Water Use Category	Total sales	Intermediate sales	Final sales	Jobs	Income	Business taxes
Irrigation	\$78.03	\$8.73	\$69.30	618	\$20.24	\$0.85
Livestock	\$2,637.85	\$1,339.95	\$1,297.90	16,521	\$499.23	\$21.09
Manufacturing	\$62,475.81	\$19,826.73	\$42,649.08	80,609	\$9,096.38	\$255.38
Mining	\$3,693.95	\$1,475.81	\$2,218.13	7,862	\$1,831.54	\$200.96
Steam-electric	\$990.40	\$278.62	\$711.78	1,893	\$687.65	\$117.45
Municipal	\$33,562.37	\$9,053.48	\$24,508.89	373,890	\$19,618.82	\$1,723.75
Regional total	\$103,438.41	\$31,983.32	\$71,455.08	481,393	\$31,753.86	\$2,319.48

^a Appendix 1 displays data for individual IMPLAN sectors that make up each water use category. Based on data from the Texas Water Development Board, and year 2006 data from the Minnesota IMPLAN Group, Inc.

2.2 Impacts of Agricultural Water Shortages

According to the 2011 East Texas Regional Water Plan, during severe drought the counties of Hardin, Houston, San Augustine and Smith would experiences shortages of irrigation water. In 2010, shortages range from about 1 to 48 percent of annual irrigation demands, and farmers would be short nearly 1,675 acre-feet in 2010 and nearly 3,420 acre-feet in 2060. Shortages of these magnitudes would reduce gross state product (income plus state and local business taxes) by less than \$1 million per year in each decade.

Table 9: Economic Impacts of Water Shortages for Irrigation Water User Groups (\$millions)					
Decade	Lost income from reduced crop production ^a	Lost state and local tax revenues from reduced crop production	Lost jobs from reduced crop production		
2010	\$0.18	\$0.03	2		
2020	\$0.19	\$0.03	2		
2030	\$0.23	\$0.03	2		
2040	\$0.40	\$0.04	2		
2050	\$0.48	\$0.05	2		
2060	\$0.57	\$0.05	3		

^{*}Changes to income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

Shortages for livestock producers are reported for Angelina, Henderson, Houston, Nacogdoches, Sabine, San Augustine, and Shelby counties. Shortages of these magnitudes would reduce gross state product (income plus state and local business taxes) by \$14 million per year in 2010, and \$551 million in 2060 (Table 10).

Table 10: Economic Impacts of Water Shortages for Livestock Water User Groups (\$millions) ^a						
Decade	Lost income from reduced livestock production b	Lost state and local tax revenues from reduced livestock production	Lost jobs from reduced livestock crop production			
2010	\$13.22	\$0.60	124			
2020	\$53.29	\$2.43	500			
2030	\$92.78	\$4.23	873			
2040	\$266.31	\$12.12	2,495			
2050	\$390.77	\$17.79	3,660			
2060	\$527.74	\$24.02	4,942			

^a Includes impacts to forward processors (meat packing and poultry processing).

2.3 Impacts of Municipal Water Shortages

Water shortages are projected to occur in a significant number of communities in the region. Deficits range from approximately 1 to roughly 75 percent of total annual water use. At the regional level, the estimated economic value of domestic water shortages totals \$19 million in 2010 and \$157 million in 2060 (Table 11). Due to curtailment of commercial business activity operation, municipal shortages would reduce gross state product (income plus taxes) by an estimated \$34 million in 2020 and \$162 million in 2060.

^b Changes to income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

Decade	Monetary value of domestic water shortages	Lost income from reduced commercial business activity*	Lost state and local taxes from reduced commercial business activity	Lost jobs from reduced commercial business activity	Lost water utility revenues
2010	\$19.03	\$0.00	\$0.00	0	\$6.16
2020	\$65.60	\$33.91	\$3.61	754	\$10.21
2030	\$84.52	\$42.30	\$4.50	941	\$12.92
2040	\$102.76	\$51.89	\$5.53	1,156	\$16.54
2050	\$193.14	\$129.22	\$13.84	2,898	\$22.23
2060	\$162.16	\$162.23	\$17.55	3,683	\$29.75

^{*}Changes to Income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

2.4 Impacts of Manufacturing Water Shortages

Manufacturing water shortages in the region are projected to occur in Angelina, Henderson, Houston, Nacogdoches, Sabine, San Augustine, and Shelby counties. In 2010, the East Texas planning group estimates that these manufacturers would be short about 3,400 acre-feet; and by 2060, this figure increases to nearly 50,000 acre-feet. Shortages of these magnitudes would reduce gross state product (income plus taxes) by an estimated \$41 million in 2010 and \$1.2 billion in 2060 (Table 12).

Table 12: Economic Impacts of Water Shortages for Manufacturing Water User Groups (Smillions)

Decade	Lost income due to reduced manufacturing output	Lost state and local business tax revenues due to reduced manufacturing output	Lost jobs due to reduced manufacturing output
2010	\$40.43	\$1.28	79
2020	\$292.52	\$9.01	651
2030	\$397.41	\$12.09	1,114
2040	\$878.32	\$26.94	2,038
2050	\$1,026.90	\$31.44	2,516
2060	\$1,188.24	\$36.33	3,046

^{*}Changes to Income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

2.5 Impacts of Mining Water Shortages

Ming water shortages in Region I are projected to occur in San Augustine, Angelina, Jefferson, Nacogdoches, Newton and Rusk counties, and would primarily affect extraction of gas in the Haynesville shale formation. Combined shortages for each county would result in estimated losses in gross state product totaling \$1.2 billion dollars in 2010, and about \$900 million 2060 (Table 13).

	Table 13: Economic Impacts of Water Shortages for Mining Water User Groups (\$millions)						
Decade	Lost income due to reduced mining output	Lost state and local business tax revenues due to reduced mining output	Lost jobs due to reduced mining output				
2010	\$1,105.82	\$99.40	8,178				
2020	\$2,226.70	\$222.67	16,468				
2030	\$701.19	\$70.12	5,186				
2040	\$749.60	\$74.96	5,544				
2050	\$797.20	\$79.72	5,896				
2060	\$834.13	\$83.41	6,169				

^{*}Changes to Income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

2.6 Impacts of Steam-electric Water Shortages

Water shortages for electrical generating units are projected to occur in Anderson, Angelina, Jefferson, Nacogdoches, Newton, and Rusk counties, and would result in estimated losses of gross state product totaling \$119 million dollars in 2020, and \$3.7 billion 2060 (Table 14).

	Table 14: Economic Impacts of Water Shortages for Steam-electric Water User Groups (\$millions)						
Decade	Lost income due to reduced electrical generation	Lost state and local business tax revenues due to reduced electrical generation	Lost jobs due to reduced electrical generation				
2010	\$104.61	\$15.01	356				
2020	\$640.67	\$91.96	2,178				
2030	\$853.57	\$122.52	2,902				
2040	\$1,662.28	\$238.59	5,651				
2050	\$2,682.62	\$385.05	9,119				
2060	\$3,244.45	\$465.69	11,029				

^{*}Changes to Income and business taxes are collectively equivalent to a decrease in gross state product, which is analogous to gross domestic product measured at the state rather than national level. Appendix 2 shows results by water user group.

2.7 Social Impacts of Water Shortages

As discussed previously, estimated social impacts focus on changes in population and school enrollment in the region. In 2010, estimated population losses total 10,511 with corresponding reductions in school enrollment of 2,965 students (Table 15). In 2060, population in the region would decline by 34,773 and school enrollment would fall by 9,865.

Table 15: Social Impacts of Water Shortages (2010-2060)					
Year	Population Losses	Declines in School Enrollment			
2010	10,511	2,965			
2020	24,754	7,023			
2030	13,269	3,764			
2040	20,337	5,770			
2050	29,015	8,232			
2060	34,773	9,865			

2.8 Distribution of Impacts by Major River Basin

Administrative rules require that impacts are presented by both planning region and major river basin. To meet rule requirements, impacts were allocated among basins based on the distribution of water shortages in relevant basins. For example, if 50 percent of water shortages in River Basin A and 50 percent occur in River Basin B, then impacts were split equally among the two basins. Table 16 displays the results.

Water Use	2010	2020	2030	2040	2050	2060

Groundwater Mana	agement Area 14

Groundwater Management Area 14 Meeting

Lone Star Groundwater Conservation District Offices

Conroe, Texas

September 23, 2014

Today's Considerations

- TWC Section 36.108 (d) (6) socioeconomic impacts reasonably expected to occur
- TWC Section 36.108 (d) (7) impact on the interests and rights in private property

Texas Water Code Section 36.108 (d) (7)

Consideration of the impact on the interests and rights in private property, including ownership and the rights of management area landowners and their lessees and assigns in groundwater, as recognized under Texas Water Code Section 36.002.

Texas Water Code Section 36.108 (d) (7)

For reference, Texas Water Code Section 36.002 states:

- (a) The legislature recognizes that a landowner owns the groundwater below the surface of the landowner's land as real property.
- (b) The groundwater ownership and rights described by this section:
- (1) entitle the landowner, including a landowner's lessees, heirs, or assigns, to drill for and produce the groundwater below the surface of real property, subject to Subsection (d), without causing waste or malicious drainage of other property or negligently causing subsidence, but does not entitle a landowner, including a landowner's lessees, heirs, or assigns, to the right to capture a specific amount of groundwater below the surface of that landowner's land; and

Texas Water Code Section 36.108 (d) (7)

For your reference, Texas Water Code Section 36.002 states (cont.):

- (2) do not affect the existence of common law defenses or other defenses to liability under the rule of capture.
- (c) Nothing in this code shall be construed as granting the authority to deprive or divest a landowner, including a landowner's lessees, heirs, or assigns, of the groundwater ownership and rights described by this section.

Texas Water Code 36.002

- (d) This section does not:
- (1) prohibit a district from limiting or prohibiting the drilling of a well by a landowner for failure or inability to comply with minimum well spacing or tract size requirements adopted by the district;
- (2) affect the ability of a district to regulate groundwater production as authorized under Section 36.113, 36.116, or 36.122 or otherwise under this chapter or a special law governing a district; or
- (3) require that a rule adopted by a district allocate to each landowner a proportionate share of available groundwater for production from the aquifer based on the number of acres owned by the landowner.

Texas Water Code 36.002

- (e) This section does not affect the ability to regulate groundwater in any manner authorized under:
- (1) Chapter 626, Acts of the 73rd Legislature, Regular Session, 1993, for the Edwards Aquifer Authority;
- (2) Chapter 8801, Special District Local Laws Code, for the Harris-Galveston Subsidence District; and
- (3) Chapter 8834, Special District Local Laws Code, for the Fort Bend Subsidence District.

The protection of private property rights by GCDs in GMA 14

The procedural requirements for what should be considered in reviewing the private property rights factor are not prescribed in statute nor do TWDB rules provide any additional guidance. The following list of topics are suggested for discussion:

- Existing uses within the GCD
- Projected future uses within the GCD
- Investment-backed expectations of existing users and property owners within the GCD

The protection of private property rights by GCDs in GMA 14 (Continued)

- Long-term viability of groundwater resources in area
- Availability of water to all properties and ability to allocate MAG through rules after DFC adoption
- Whether immediate cutbacks would be required in setting a particular DFC or whether cutbacks, if any, would need to occur over a certain timeframe

The protection of private property rights by GCDs in GMA 14 (Continued)

- For outcrop areas, how the outcrop depletes rapidly in dry times, and whether drought rules or triggers based on the DFC/MAG for the outcrop could be beneficial to ensure viability of the resource during dry times
- Economic consequences to existing users (i.e., cost to drop pumps, reconfigure or drill new wells upon water table dropping, etc.). Also consider the reverse—economic consequences of less water available to protect the existing users from the economic consequences relevant to existing users—reaching a balance between these two dynamics.

The protection of private property rights by GCDs in GMA 14 (Continued)

- Those GCDs with existing rules developed based on the current DFC might find it helpful to review the rules that the GCD considers relevant as we work to adopt DFCs over the next year. For example, the rules and Management Plan in place based on the current DFCs can help determine how a GCD currently impacts private property rights and whether those same interests are important as we work to adopt DFCs over the next 2 years.
- Focusing on finding a balance, as that balance is defined by each GCD, between all of these considerations

Groundwater Mana	agement Area 14

RESOLUTION ESTABLISHING ADMINISTRATIVE PROCEDURES FOR THE CONSIDERATION, PROPOSAL, AND ADOPTION OF DESIRED FUTURE CONDITIONS FOR GROUNDWATER MANAGEMENT AREA 14

WHEREAS, pursuant to Section 35.004 of the Texas Water Code, the Texas Water Development Board ("TWDB") has designated groundwater management areas, which together cover all major and minor aquifers in the state, for the objective of providing the most suitable area for the management of the groundwater resources; and

WHEREAS, through Title 31, Section 356.21 of the Texas Administrative Code, the TWDB has designated the area encompassing all of Austin, Brazoria, Chambers, Fort Bend, Galveston, Grimes, Hardin, Harris, Jasper, Jefferson, Liberty, Montgomery, Newton, Orange, Polk, San Jacinto, Tyler, Walker, Waller, and Washington counties as Groundwater Management Area No. 14 ("GMA 14"); and

WHEREAS, the Bluebonnet Groundwater Conservation District, Brazoria County Groundwater Conservation District, Lone Star Groundwater Conservation District, Lower Trinity Groundwater Conservation District, and Southeast Texas Groundwater Conservation District (the "Member Districts") are located wholly or partially within GMA 14; and

WHEREAS, the Member Districts are authorized by Chapter 36, Texas Water Code, to engage in joint planning activities for the coordinated management of the aquifers located in GMA 14, and in that regard, shall establish desired future conditions ("DFCs") for the relevant aquifers within GMA 14; and

WHEREAS, Section 36.108 of the Texas Water Code requires the Member District Representatives to hold joint planning meetings for the consideration of DFC options, the proposal of DFCs for adoption, and, after the contemplation of comments and suggested revisions provided by the public and Member Districts, the adoption of DFCs for each relevant aquifer in GMA 14 and the submission of an explanatory report to the TWDB for approval of the DFCs adopted; and

WHEREAS, Section 36.108(d-3) of the Texas Water Code provides that the explanatory report must include the following: (1) identification of each DFC; (3) the policy and technical justification for each DFC; (3) documentation that the Member Districts considered the nine statutory factors listed in 36.108(d)(1)-(9), Water Code, and how the DFC adopted impacts each factor, (4) a list of the other DFC options considered, if any, and the reasons why those options were not adopted, and (5) the reasons why recommendations made by advisory committees and relevant public comments received by the districts were or were not incorporated into the DFCs; and

WHEREAS, the DFC explanatory report serves as the administrative record in the DFC adoption process, and for this reason, the Member Districts recognize the importance of establishing a procedural record from the beginning of the DFC consideration, proposal, and

adoption process that contemplates each of the items to be addressed and included in the explanatory report under Section 36.108(d-3), Water Code; and

WHEREAS, Section 36.108 of the Texas Water Code provides a clear procedural process for DFCs that have been approved by a two-thirds vote by the Member District Representatives as the proposed DFCs for distribution to the Member Districts for public hearings and subject to a public comment period, but the statute is less clear as to the procedure applicable to the consideration of one or more DFC option(s), DFC options that may be discussed, evaluated, or considered but not adopted, the extent to which those DFC options must be addressed in the explanatory report, and the consideration of the nine statutory factors prior to the Member District Representatives' vote to approve a DFC option as the proposed DFC; and

WHEREAS, the Member Districts desire to adopt an administrative procedural process that is consistent with Chapter 36, including the procedural requirements currently in place under Texas Water Code Section 36.108, for the consideration, proposal, and adoption of DFCs to ensure the development of a clear administrative record that not only supports the DFCs ultimately adopted, but also addresses any DFCs considered but not adopted, in a manner that is sufficient for inclusion in the explanatory report as required by Texas Water Code Section 36.108(d-3); and

NOW, THEREFORE, it is agreed and understood among the Member Districts as follows:

SECTION ONE INTENT AND PURPOSES

1.01 It is the intent and purpose of the Member Districts to carry out and fulfill the joint planning activities and requirements of Chapter 36, Texas Water Code, to establish DFCs by adopting administrative procedures for the consideration, proposal, and adoption of DFCs that promote the consideration of various DFC options, as necessary, to be included in the explanatory report, while preventing the lack of procedural guidance provided in Texas Water Code Chapter 36 from hindering the development of a defensible administrative record or explanatory report. The Member Districts intend for the administrative procedures herein to promote the ability of the Member Districts to openly identify, evaluate, and discuss multiple ideas, proposals, technical information, and policy options regarding the establishment of DFCs while simultaneously establishing some procedures to identify when a particular discussion or evaluation rises to the level of it being formally considered for inclusion in the DFC explanatory report.

SECTION TWO

PARTICIPATION IN JOINT PLANNING PROCESS TO ESTABLISH DFCs

- 2.01 Each Member District shall be subject to these administrative procedures.
- 2.02 Only a Member District Representative may vote or take action on GMA 14 activities. For any action, only one representative from each Member District may vote.

- 2.03 Each Member District of GMA 14 shall endeavor to participate and contribute in good faith in joint planning activities and to satisfy the joint planning requirements of Chapter 36, Water Code.
- 2.04 The GMA 14 Member Districts, as a group to engage in joint planning activities, shall have only the power granted by Chapter 36, Water Code, that relates to joint planning activities.
- 2.05 GMA 14 joint planning meetings must be held in accordance with the Texas Open Meetings Act, Chapter 551, Government Code. The Member Districts agree that notice of meetings shall be provided in accordance with the requirements of Chapter 36, Texas Water Code.
- 2.06 Each Member District shall comply with the Texas Public Information Act, Chapter 552, Government Code, with regard to joint planning activities.

SECTION THREE

PROCEDURE FOR THE CONSIDERATION, PROPOSAL, AND ADOPTTION OF DFCs

- 3.01 For a DFC option to be formally considered as a potential candidate for proposal and adoption by the Member Districts to be included in the explanatory report as a DFC that was adopted or a DFC that was considered but not adopted pursuant to Section 36.108(d-3), Water Code, the DFC option must be requested in writing and approved by the Member District Representatives for formal consideration at a GMA 14 joint planning meeting.
- 3.02 A Member District Representative shall request a DFC option to be approved for formal consideration by submitting, no less than 14 days before a GMA 14 joint planning meeting, a written request to each Member District and the Contracted Consultant, as defined in Section 4 below, describing with sufficient specificity the DFC option requested to be approved for formal consideration. The sufficiency of the written request shall be reviewed by the Contracted Consultant and, no later than 7 days after receiving the written request, the Contract Consultant shall notify the requesting party of any possible deficiencies in the written request in preparation for discussion of the request at the GMA 14 joint planning meeting.
- 3.03 Based on the information provided in the written request, including any supplemental information provided in writing and accepted by the Member District Representatives at or before the GMA 14 joint planning meeting, the Member District Representatives shall vote to determine whether the requested DFC option shall be formally considered. To be formally considered, the requested DFC option must be approved by a two-thirds vote of the total Member District Representatives. If through discussions at the GMA 14 joint planning meeting, the DFC option originally requested in writing is amended, the DFC option, as amended, may nonetheless be approved for formal consideration by a two-thirds vote of the total Member District Representatives without the submission of an additional, amended

written request. A DFC option approved for formal consideration under this section shall be included in the explanatory report pursuant to Texas Water Code Section 36.108(d-3).

- 3.04 Of the DFC options formally considered, at least one of the DFC options shall be approved by two-thirds vote of the total Member District Representatives to be further reviewed in consideration of the nine statutory factors listed in Section 36.108(d)(1)-(9), Water Code. For a DFC option approved for further review, the Member District Representatives shall discuss and consider the nine statutory factors and how the DFC option impacts each of the nine factors at a joint planning meeting. A written report shall be prepared to document the consideration of the nine statutory factors and the discussions relevant to the DFC option's impact to each factor, to the extent necessary for purposes of the explanatory report as required by Section 36.108(d-3)(3), Water Code.
- 3.05 Only after consideration of the nine statutory factors as stated in Section 3.04 may a DFC option become eligible for approval as the proposed DFC. For each relevant aquifer in GMA 14, the Member District Representatives shall approve by two-thirds vote of the total Member District Representatives one DFC option to serve as the proposed DFC as required by Sections 36.108(d) and (d-2), Water Code. The proposed DFC must provide a balance between the highest practicable level of groundwater production and the conservation, preservation, protection, recharging, and prevention of waste of groundwater and control of subsidence in GMA 14.
- 3.06 The proposed DFC approved by two-thirds vote of the total Member District Representatives shall be distributed to the Member Districts. A period of not less than 90 days for public comment begins on the day the proposed DFC is mailed to the Member Districts.
- 3.07 During the public comment period and after posting proper notice as required by Section 36.063, Water Code, each Member District shall hold a public hearing on the proposed DFCs relevant to that Member District pursuant to the requirements set forth in Section 36.108(d-2), Water Code. After the public hearing, each Member District shall compile for consideration at the next joint planning meeting a summary report of relevant comments received and any suggested revisions to the proposed DFC and the basis for the revisions.
- 3.08 Pursuant to Texas Water Code Section 36.108(d-3), after the earlier of the date on which all the Member District have submitted their district summaries or the expiration of the public comment period, the Member District Representatives shall reconvene to review the reports, consider any Member District's suggested revisions to the proposed DFCs, and vote to adopt the proposed DFCs. The DFCs must be adopted as a resolution by a two-thirds vote of all the Member District Representatives.
- 3.09 A record shall be prepared to address each relevant comment received during the public comment period or at the public hearing and any suggested revisions included in the Member Districts' summary reports submitted to and considered by the Member District Representatives at the joint planning meeting, as well as any recommendations made by advisory committees. The record shall identify those comments and revisions incorporated into the DFC, as well as those comments and revisions not incorporated, and provide the reasoning behind the

decision to incorporate or not to incorporate the comments or revisions, and the record shall be included in the explanatory report as required by Texas Water Code Section 36.108(d-3)(5).

- 3.10 Upon adoption of the DFCs, the Member District Representatives shall prepare an explanatory report as required by Texas Water Code Section 36.108(d-3). Consistent with the statutory requirements and the procedural requirements adopted by this resolution, the explanatory report shall:
 - a. identify each DFC adopted pursuant to Section 3.08;
 - b. provide the policy and technical justifications for each DFC adopted;
 - c. include the written reports required by Section 3.04, relevant to the DFCs adopted, that document the discussions of the Member District Representatives in consideration of the nine factors listed in Texas Water Code 36.108(d)(1)-(9) and how the adopted DFCs impact each factor, inclusive of any amendments or supplemental information deemed necessary and taken into consideration for the adopted DFCs after the vote to approve the proposed DFCs under Section 3.05;
 - d. list the other DFC options approved for formal consideration under Sections 3.03, but not adopted, and the reasons why those options were not adopted, based on the written reports prepared for each DFC option approved for formal consideration under Section 3.03 or further review under Section 3.04; and
 - e. discuss reasons why recommendations made by advisory committees, if any, and relevant public comments received by the Member Districts were or were not incorporated into the DFCs by inclusion of the record prepared pursuant to Section 3.09; and
 - f. describe how the DFCs provide a balance between the highest practicable level of groundwater production and the conservation, preservation, recharging, and prevention of waste of groundwater and control of subsidence in GMA 14.
- 3.11 The Member District Representatives shall submit to the TWDB and each Member District proof that notice was posted for the joint planning meeting to adopt the DFCs, a copy of the resolution adopting the DFCs, and a copy of the explanatory report.
- 3.12 As soon as possible after the Member Districts receives the DFCs resolution and explanatory report, the Member district shall adopt the DFCs in the resolution and explanatory report that applies to the Member District.

SECTION FOUR DEFINITIONS

These terms shall have the following meaning when used herein:

Advisory Committee: A nonvoting advisory committee or subcommittee, appointed by the Member District Representatives during the joint planning process, who represent social, governmental, environmental, or economic interest to assist in the development of DFCs as provided by Texas Water Code Section 36.1081. The appointment of an advisory committee by the Member District Representatives during the joint planning process is permissible and not mandatory.

Contracted Consultant: The consultant retained by the Member Districts to assist in conducting joint planning activities, developing DFCs for the relevant aquifers in GMA 14, and preparing the explanatory report as required by Section 36.108(d-3) of the Texas Water Code.

Desired Future Condition or DFC: The desired future conditions for the relevant aquifers within GMA 14 established in accordance with Chapter 36, Texas Water Code.

Groundwater Management Area 14 or GMA 14: Groundwater Management Area 14 as designated by the Texas Water Development Board and as may be amended from time to time.

Member District: A groundwater conservation district subject to Texas Water Code Chapter 36 that is located in whole or in part inside GMA 14, including the Bluebonnet Groundwater Conservation District, Brazoria County Groundwater Conservation District, Lone Star Groundwater Conservation District, Lower Trinity Groundwater Conservation District, and Southeast Texas Groundwater Conservation District. If the creation of a particular district requires confirmation through an election, the district shall not be a Member District until it is confirmed.

Member District Representative: The presiding officer or the presiding officer's designee for any district located wholly or partly in GMA 14.

NOW, THEREFORE, BE IT RESOLVED BY THE MEMBER DISTRICTS OF GROUNDWATER MANAGEMENT AREA 14:

- 1) Each of the affirmations and recitals set forth herein are true and correct;
- 2) The authorized voting representatives of the GMA 14 Member Districts have approved by a two-thirds vote of the total number of Member Districts in GMA 14 the administrative procedures set forth herein; and
- 3) Any previous administrative procedure agreed to by the Member Districts that is in conflict with the administrative procedures set forth herein is superseded by the administrative procedures set forth in this resolution for future actions of the Member Districts.

AND IT IS SO ORDERED.			. 1
